Preface	<i>page xv</i>
<b>1 What is the quark–gluon plasma?</b>	<b>1</b>
1.1 Asymptotic freedom and confinement in QCD	1
1.2 Chiral symmetry breaking in QCD	4
1.3 Recipes for quark–gluon plasma	5
1.4 Where can we find QGP?	6
1.5 Signatures of QGP in relativistic heavy ion collisions	9
1.6 Perspectives on relativistic heavy ion experiments	12
1.7 Natural units and particle data	14
<b>Part I: Basic Concept of Quark–Gluon Plasma</b>	<b>15</b>
<b>2 Introduction to QCD</b>	<b>17</b>
2.1 Classical QCD action	17
2.2 Quantizing QCD	19
2.3 Renormalizing QCD	22
2.3.1 Running coupling constants	24
2.3.2 More on asymptotic freedom	27
2.4 Global symmetries in QCD	28
2.4.1 Chiral symmetry	28
2.4.2 Dilatational symmetry	29
2.5 QCD vacuum structure	30
2.6 Various approaches to non-perturbative QCD	32
Exercises	36
<b>3 Physics of the quark–hadron phase transition</b>	<b>39</b>
3.1 Basic thermodynamics	39
3.2 System with non-interacting particles	43
3.3 Hadronic string and deconfinement	44
3.4 Percolation of hadrons	45
3.5 Bag equation of state	46
3.6 Hagedorn’s limiting temperature	50
3.7 Parametrized equation of state	51
3.8 Lattice equation of state	53
Exercises	55

<b>4</b>	<b>Field theory at finite temperature</b>	57			134
4.1	Path integral representation of $Z$	57			
4.2	Black body radiation	60			
4.3	Perturbation theory at finite $T$ and $\mu$	62			
	4.3.1 Free propagators	63			
	4.3.2 Vertices	64			
	4.3.3 Feynman rules	65			
4.4	Real-time Green's functions	66			
4.5	Gluon propagator at high $T$ and zero $\mu$	69			
4.6	Quark propagator at high $T$ and zero $\mu$	75			
4.7	HTL resummation	77			
4.8	Perturbative expansion of the pressure up to $O(g^5)$	78			
4.9	Infrared problem of $O(g^6)$ and beyond	81			
4.10	Debye screening in QED plasma	82			
4.11	Vlasov equations for QED plasma	84			
4.12	Vlasov equations for QCD plasma	87			
	Exercises	88			
<b>5</b>	<b>Lattice gauge approach to QCD phase transitions</b>	92			
5.1	Basics of lattice QCD	92			
	5.1.1 The Wilson line	92			
	5.1.2 Gluons on the lattice	94			
	5.1.3 Fermions on the lattice	95			
	5.1.4 Partition function on the lattice	98			
5.2	The Wilson loop	99			
5.3	Strong coupling expansion and confinement	101			
5.4	Weak coupling expansion and continuum limit	102			
5.5	Monte Carlo simulations	105			
5.6	Lattice QCD at finite $T$	109			
5.7	Confinement–deconfinement transition in $N_f = 0$ QCD	111			
5.8	Order of the phase transition for $N_f = 0$	115			
5.9	Effect of dynamical quarks	116			
5.10	Effect of finite chemical potential	117			
	Exercises	118			
<b>6</b>	<b>Chiral phase transition</b>	122			
6.1	$\langle \bar{q}q \rangle$ in hot/dense matter	122			
	6.1.1 High-temperature expansion	123			
	6.1.2 Low-temperature expansion	123			
6.2	The NJL model	124			
	6.2.1 Dynamical symmetry breaking at $T = 0$	126			
	6.2.2 Symmetry restoration at $T \neq 0$	127			
6.3	Mean-field theory and the Landau function	129			
	6.3.1 Order of the phase transition	129			
	6.3.2 Second order phase transition	131			
			6.3.3 First order transition driven by cubic interaction		134
			6.3.4 Tricritical behavior with sextet interaction		135
			6.4 Spatial non-uniformity and correlations		137
			6.5 Critical fluctuation and the Ginzburg region		139
			6.6 Renormalization group and $\epsilon$ -expansion		141
			6.6.1 Renormalization in $4 - \epsilon$ dimensions		141
			6.6.2 Running couplings		143
			6.6.3 Vertex functions		144
			6.6.4 RG equation for vertex function		145
			6.7 Perturbative evaluation of $\beta_i$		146
			6.8 Renormalization group equation and fixed point		147
			6.8.1 Dimensional analysis and solution of RG equation		147
			6.8.2 Renormalization group flow		149
			6.9 Scaling and universality		152
			6.9.1 Scaling at the critical point		152
			6.9.2 Scaling near the critical point		153
			6.10 Magnetic equation of state		154
			6.11 Stability of the fixed point		156
			6.12 Critical exponents for the $O(N)$ -symmetric $\phi^4$ model		156
			6.13 Chiral phase transition of QCD at finite $T$		158
			6.13.1 Landau functional of QCD		159
			6.13.2 Massless QCD without axial anomaly		160
			6.13.3 Massless QCD with axial anomaly		161
			6.13.4 Effect of light quark masses		163
			6.13.5 Effect of finite chemical potential		165
			Exercises		166
<b>7</b>	<b>Hadronic states in a hot environment</b>	170			
7.1	Heavy quarkonia in hot plasma	170			
	7.1.1 $Q\bar{Q}$ spectra at $T = 0$	170			
	7.1.2 $Q\bar{Q}$ at $T \neq 0$	172			
	7.1.3 Charmonium suppression at high $T$	174			
	7.1.4 Correlation of Polyakov lines in lattice QCD	174			
7.2	Light quarkonia in a hot medium	176			
	7.2.1 $q\bar{q}$ spectra at $T = 0$	176			
	7.2.2 Nambu–Goldstone theorem at finite $T$	178			
	7.2.3 Virial expansion and the quark condensate	179			
	7.2.4 Pions at low $T$	180			
	7.2.5 Vector mesons at low $T$	182			
7.3	In-medium hadrons from lattice QCD	183			
7.4	Photons and dileptons from hot/dense matter	185			
	7.4.1 Photon production rate	186			
	7.4.2 Dilepton production rate	187			
	Exercises	188			

<b>Part II: Quark–Gluon Plasma in Astrophysics</b>	191	<b>Part III: Quark–Gluon Plasma in Relativistic Heavy Ion Collisions</b>	245
<b>8 QGP in the early Universe</b>	193	<b>10 Introduction to relativistic heavy ion collisions</b>	247
8.1 Observational evidence for the Big Bang	193	10.1 Nuclear stopping power and nuclear transparency	247
8.2 Homogeneous and isotropic space	197	10.2 Space-time picture of collisions	250
8.2.1 Robertson–Walker metric	197	10.3 Central plateau and fragmentation region	253
8.2.2 Hubble’s law and red shift	198	10.4 Time history of ultra-relativistic AA collisions	254
8.2.3 Horizon distance	199	10.5 Geometry of heavy ion collisions	256
8.3 Expansion law of the Universe	200	10.6 Past, current and future accelerators	259
8.3.1 The Einstein equation	200	<b>11 Relativistic hydrodynamics for heavy ion collisions</b>	261
8.3.2 Critical density	201	11.1 Fermi and Landau pictures of multi-particle production	261
8.3.3 Solution of the Friedmann equation	202	11.2 Relativistic hydrodynamics	265
8.3.4 Entropy conservation	204	11.2.1 Perfect fluid	265
8.3.5 Age of the Universe	204	11.2.2 Dissipative fluid	267
8.4 Thermal history of the Universe: from QGP to CMB	206	11.3 Bjorken’s scaling solution	269
8.5 Primordial nucleosynthesis	209	11.3.1 Perfect fluid	270
8.6 More on the QCD phase transition in the early Universe	211	11.3.2 Effect of dissipation	273
8.6.1 $t < t_1$ ( $T > T_c$ )	213	11.4 Relation to the observables	274
8.6.2 $t_1 < t < t_f$ ( $T = T_c$ )	214	Exercises	276
8.6.3 $t > t_f$ ( $T < T_c$ )	214	<b>12 Transport theory for the pre-equilibrium process</b>	278
Exercises	215	12.1 Classical Boltzmann equation	278
<b>9 Compact stars</b>	217	12.2 Boltzmann’s H-theorem	282
9.1 Characteristic features of neutron stars	218	12.3 Covariant form of the classical transport equation	283
9.2 Newtonian compact stars	220	12.3.1 Conservation laws	284
9.2.1 White dwarfs	221	12.3.2 Local H-theorem and local equilibrium	285
9.2.2 Neutron stars	223	12.4 Quantum transport theory	286
9.3 General relativistic stars	224	12.4.1 The density matrix	287
9.3.1 Maximum mass of compact stars	224	12.4.2 The Dirac equation	287
9.3.2 Oppenheimer–Volkoff equation	226	12.4.3 The Wigner function	288
9.3.3 Schwarzschild’s uniform density star	229	12.4.4 Equation of motion for $W(x, p)$	290
9.4 Chemical composition of compact stars	229	12.4.5 Semi-classical approximation	291
9.4.1 Neutron star matter and hyperon matter	229	12.4.6 Non-Abelian generalization	293
9.4.2 u, d quark matter	232	12.5 Phenomenological transport equation in QCD	294
9.4.3 u, d, s quark matter	233	Exercises	295
9.5 Quark–hadron phase transition	233	<b>13 Formation and evolution of QGP</b>	297
9.5.1 Equation of state for nuclear and neutron matter	234	13.1 The initial condition	298
9.5.2 Equation of state for quark matter	236	13.1.1 Color-string breaking model	298
9.5.3 Stable strange matter	239	13.1.2 Color glass condensate	299
9.6 Phase transition to quark matter	239	13.1.3 Perturbative QCD models	300
9.7 Structure of neutron stars and quark stars	240	13.2 Minijet production	302
9.7.1 Mass–radius relation of neutron stars	240	13.3 Longitudinal plasma expansion with QCD phase transition	305
9.7.2 Strange quark stars	242	13.4 Transverse plasma expansion	307
9.8 Various phases in high-density matter	243	13.5 Transverse momentum spectrum and transverse flow	309
Exercises	244	Exercises	311

<b>14</b>	<b>Fundamentals of QGP diagnostics</b>	314	17.5	Lepton pair spectrometer	386
14.1	QGP diagnostics using hadrons	314	17.6	Photon spectrometer	387
14.1.1	Probing the phase transition	314	17.7	PHENIX: a large hybrid detector	390
14.1.2	Ratios of particle yields and chemical equilibrium	315		Exercises	392
14.1.3	Transverse momentum distributions and hydrodynamical flow	316		<b>Appendix A Constants and natural units</b>	393
14.1.4	Anisotropic flow and the equation of state	317		<b>Appendix B Dirac matrices, Dirac spinors and <math>SU(N)</math> algebra</b>	396
14.1.5	Interferometry and space-time evolution	320		<b>Appendix C Functional, Gaussian and Grassmann integrals</b>	400
14.1.6	Event-by-event fluctuations	323		<b>Appendix D Curved space-time and the Einstein equation</b>	404
14.1.7	Hadron production by quark recombination	325		<b>Appendix E Relativistic kinematics and variables</b>	412
14.2	QGP diagnostics using hard probes: jet tomography	327		<b>Appendix F Scattering amplitude, optical theorem and elementary parton scatterings</b>	418
14.3	QGP diagnostics using leptons and photons	330		<b>Appendix G Sound waves and transverse expansion</b>	424
14.3.1	Drell–Yan production of dileptons	330		<b>Appendix H Tables of particles</b>	429
14.3.2	$J/\psi$ suppression and Debye screening in QGP	332		<i>References</i>	431
14.3.3	Thermal photons and dileptons	334		<i>Index</i>	440
	Exercises	336			
<b>15</b>	<b>Results from CERN-SPS experiments</b>	338			
15.1	Relativistic heavy ion accelerators	339			
15.2	Basic features of AA collisions	339			
15.2.1	Single-particle spectra	340			
15.2.2	Collective expansion	343			
15.2.3	HBT two-particle correlation	343			
15.3	Strangeness production and chemical equilibrium	345			
15.4	$J/\psi$ suppression	347			
15.5	Enhancement of low-mass dileptons	349			
15.6	Observation of direct photons	351			
<b>16</b>	<b>First results from the Relativistic Heavy Ion Collider (RHIC)</b>	353			
16.1	Heavy ion acceleration and collisions in the RHIC	353			
16.2	Particle production	357			
16.3	Transverse momentum distributions	361			
16.4	HBT correlations	363			
16.5	Thermalization	364			
16.6	Azimuthal anisotropy	366			
16.7	Suppression of high- $p_T$ hadrons	369			
16.8	Modification of the jet structure	371			
16.9	Quark-number scaling	373			
<b>17</b>	<b>Detectors in relativistic heavy ion experiments</b>	375			
17.1	Features of relativistic heavy ion collisions	375			
17.2	Transverse energy, $E_T$	377			
17.3	Event characterization detectors	378			
17.4	Hadron spectrometer	378			
17.4.1	Particle identification using $dE/dx$ measurements	381			
17.4.2	Particle identification using time of flight measurements	381			
17.4.3	Particle identification using Cherenkov detectors	384
