Introduction: The photon	1
1 Planck's radiation law and the Einstein coefficients	3
1.1 Density of field modes in a cavity	4
1.2 Quantization of the field energy	7
1.3 Planck's law	10
1.4 Fluctuations in photon number	13
1.5 Einstein's A and B coefficients	16
1.6 Characteristics of the three Einstein transitions	19
1.7 Optical excitation of two-level atoms	23
1.8 Theory of optical attenuation	27
1.9 Population inversion: optical amplification	31
1.10 The laser	35
1.11 Radiation pressure	40
References	44
2 Quantum mechanics of the atom–radiation interaction	46
2.1 Time-dependent quantum mechanics	46
2.2 Form of the interaction Hamiltonian	49
2.3 Expressions for the Einstein coefficients	52
2.4 The Dirac delta-function and Fermi's golden rule	57
2.5 Radiative broadening and linear susceptibility	60
2.6 Doppler broadening and composite lineshape	65
2.7 The optical Bloch equations	68
2.8 Power broadening	72
2.9 Collision broadening	76
2.10 Bloch equations and rate equations	79
References	81
3 Classical theory of optical fluctuations and coherence	82
3.1 Models of chaotic light sources	83
3.2 The lossless optical beam-splitter	88
3.3 The Mach–Zehnder interferometer	91
3.4 Degree of first-order coherence	94
3.5 Interference fringes and frequency spectra	100
3.6 Intensity fluctuations of chaotic light	103

3.7	Degree of second-order coherence	107	6.10	Quantum theory of direct detection	271
3.8	The Brown–Twiss interferometer	114	6.11	Homodyne detection	278
3.9	Semiclassical theory of optical detection	117	6.12	The electromagnetic vacuum	284
	References	123		References	286
4	Quantization of the radiation field	125	7	Optical generation, attenuation and amplification	288
