

Contents

1. Computational Fluid Dynamics: An Introduction	1
1.1 Advantages of Computational Fluid Dynamics	1
1.2 Typical Practical Problems	7
1.2.1 Complex Geometry, Simple Physics	7
1.2.2 Simpler Geometry, More Complex Physics	8
1.2.3 Simple Geometry, Complex Physics	9
1.3 Equation Structure	11
1.4 Overview of Computational Fluid Dynamics	14
1.5 Further Reading	16
2. Partial Differential Equations	17
2.1 Background	17
2.1.1 Nature of a Well-Posed Problem	18
2.1.2 Boundary and Initial Conditions	20
2.1.3 Classification by Characteristics	21
2.1.4 Systems of Equations	24
2.1.5 Classification by Fourier Analysis	28
2.2 Hyperbolic Partial Differential Equations	30
2.2.1 Interpretation by Characteristics	30
2.2.2 Interpretation on a Physical Basis	31
2.2.3 Appropriate Boundary (and Initial) Conditions	32
2.3 Parabolic Partial Differential Equations	34
2.3.1 Interpretation by Characteristics	35
2.3.2 Interpretation on a Physical Basis	35
2.3.3 Appropriate Boundary (and Initial) Conditions	36
2.4 Elliptic Partial Differential Equations	36
2.4.1 Interpretation by Characteristics	37
2.4.2 Interpretation on a Physical Basis	37
2.4.3 Appropriate Boundary Conditions	37
2.5 Traditional Solution Methods	38
2.5.1 The Method of Characteristics	38
2.5.2 Separation of Variables	40
2.5.3 Green's Function Method	41
2.6 Closure	43
2.7 Problems	43

3. Preliminary Computational Techniques	47	5.2.2 Equations with Second Derivatives	107
3.1 Discretisation	48	5.2.3 FIVOL: Finite Volume Method Applied to Laplace's Equation	111
3.1.1 Converting Derivatives to Discrete Algebraic Expressions ..	48	5.3 Finite Element Method and Interpolation	116
3.1.2 Spatial Derivatives	49	5.3.1 Linear Interpolation	117
3.1.3 Time Derivatives	50	5.3.2 Quadratic Interpolation	119
3.2 Approximation to Derivatives	51	5.3.3 Two-Dimensional Interpolation	121
3.2.1 Taylor Series Expansion	52	5.4 Finite Element Method and the Sturm-Liouville Equation	126
3.2.2 General Technique	53	5.4.1 Detailed Formulation	126
3.2.3 Three-point Asymmetric Formula for $[\partial \bar{T} / \partial x]^n$	54	5.4.2 STURM: Computation of the Sturm-Liouville Equation ...	130
3.3 Accuracy of the Discretisation Process	55	5.5 Further Applications of the Finite Element Method	135
3.3.1 Higher-Order vs Low-Order Formulae	58	5.5.1 Diffusion Equation	135
3.4 Wave Representation	61	5.5.2 DUCT: Viscous Flow in a Rectangular Duct	137
3.4.1 Significance of Grid Coarseness	61	5.5.3 Distorted Computational Domains: Isoparametric Formulation	143
3.4.2 Accuracy of Representing Waves	62	5.6 Spectral Method	145
3.4.3 Accuracy of Higher-Order Formulae	63	5.6.1 Diffusion Equation	146
3.5 Finite Difference Method	64	5.6.2 Neumann Boundary Conditions	149
3.5.1 Conceptual Implementation	64	5.6.3 Pseudospectral Method	151
3.5.2 DIFF: Transient Heat Conduction (Diffusion) Problem	66	5.7 Closure	156
3.6 Closure	69	5.8 Problems	156
3.7 Problems	70	6. Steady Problems	163
4. Theoretical Background	73	6.1 Nonlinear Steady Problems	164
4.1 Convergence	74	6.1.1 Newton's Method	164
4.1.1 Lax Equivalence Theorem	74	6.1.2 NEWTON: Flat-Plate Collector Temperature Analysis	166
4.1.2 Numerical Convergence	75	6.1.3 NEWTBU: Two-Dimensional Steady Burgers' Equations ...	171
4.2 Consistency	76	6.1.4 Quasi-Newton Method	179
4.2.1 FTCS Scheme	77	6.2 Direct Methods for Linear Systems	180
4.2.2 Fully Implicit Scheme	78	6.2.1 FACT/SOLVE: Solution of Dense Systems	180
4.3 Stability	79	6.2.2 Tridiagonal Systems: Thomas Algorithm	183
4.3.1 Matrix Method: FTCS Scheme	81	6.2.3 BANFAC/BANSOL: Narrowly Banded Gauss Elimination .	184
4.3.2 Matrix Method: General Two-Level Scheme	82	6.2.4 Generalised Thomas Algorithm	187
4.3.3 Matrix Method: Derivative Boundary Conditions	83	6.2.5 Block Tridiagonal Systems	188
4.3.4 Von Neumann Method: FTCS Scheme	85	6.2.6 Direct Poisson Solvers	190
4.3.5 Von Neumann Method: General Two-Level Scheme	86	6.3 Iterative Methods	192
4.4 Solution Accuracy	88	6.3.1 General Structure	192
4.4.1 Richardson Extrapolation	90	6.3.2 Duct Flow by Iterative Methods	194
4.5 Computational Efficiency	92	6.3.3 Strongly Implicit Procedure	198
4.5.1 Operation Count Estimates	92	6.3.4 Acceleration Techniques	200
4.6 Closure	94	6.3.5 Multigrid Methods	203
4.7 Problems	95	6.4 Pseudotransient Method	208
5. Weighted Residual Methods	98	6.4.1 Two-Dimensional, Steady Burgers' Equations	209
5.1 General Formulation	99	6.5 Strategies for Steady Problems	211
5.1.1 Application to an Ordinary Differential Equation	101	6.6 Closure	212
5.2 Finite Volume Method	105	6.7 Problems	213
5.2.1 Equations with First Derivatives Only	105		

7. One-Dimensional Diffusion Equation	216	9.2 Numerical Dissipation and Dispersion	286
7.1 Explicit Methods	217	9.2.1 Fourier Analysis	288
7.1.1 FTCS Scheme	217	9.2.2 Modified Equation Approach	290
7.1.2 Richardson and DuFort-Frankel Schemes	220	9.2.3 Further Discussion	291
7.1.3 Three-Level Scheme	221	9.3 Steady Convection-Diffusion Equation	293
7.1.4 DIFEX: Numerical Results for Explicit Schemes	222	9.3.1 Cell Reynolds Number Effects	294
7.2 Implicit Methods	227	9.3.2 Higher-Order Upwind Scheme	296
7.2.1 Fully Implicit Scheme	227	9.4 One-Dimensional Transport Equation	299
7.2.2 Crank-Nicolson Scheme	228	9.4.1 Explicit Schemes	299
7.2.3 Generalised Three-Level Scheme	229	9.4.2 Implicit Schemes	304
7.2.4 Higher-Order Schemes	230	9.4.3 TRAN: Convection of a Temperature Front	305
7.2.5 DIFIM: Numerical Results for Implicit Schemes	231	9.5 Two-Dimensional Transport Equation	316
7.3 Boundary and Initial Conditions	236	9.5.1 Split Formulations	317
7.3.1 Neumann Boundary Conditions	236	9.5.2 THERM: Thermal Entry Problem	318
7.3.2 Accuracy of Neumann Boundary Condition Implementation	238	9.5.3 Cross-Stream Diffusion	326
7.3.3 Initial Conditions	241	9.6 Closure	328
7.4 Method of Lines	241	9.7 Problems	329
7.5 Closure	246	10. Nonlinear Convection-Dominated Problems	331
7.6 Problems	247	10.1 One-Dimensional Burgers' Equation	332
8. Multidimensional Diffusion Equation	249	10.1.1 Physical Behaviour	332
8.1 Two-Dimensional Diffusion Equation	249	10.1.2 Explicit Schemes	334
8.1.1 Explicit Methods	250	10.1.3 Implicit Schemes	337
8.1.2 Implicit Method	251	10.1.4 BURG: Numerical Comparison	339
8.2 Multidimensional Splitting Methods	251	10.1.5 Nonuniform Grid	348
8.2.1 ADI Method	252	10.2 Systems of Equations	353
8.2.2 Generalised Two-Level Scheme	254	10.3 Group Finite Element Method	355
8.2.3 Generalised Three-Level Scheme	255	10.3.1 One-Dimensional Group Formulation	356
8.3 Splitting Schemes and the Finite Element Method	256	10.3.2 Multidimensional Group Formulation	357
8.3.1 Finite Element Splitting Constructions	258	10.4 Two-Dimensional Burgers' Equation	360
8.3.2 TWDIF: Generalised Finite Difference/ Finite Element Implementation	259	10.4.1 Exact Solution	361
8.4 Neumann Boundary Conditions	266	10.4.2 Split Schemes	362
8.4.1 Finite Difference Implementation	267	10.4.3 TWBURG: Numerical Solution	364
8.4.2 Finite Element Implementation	269	10.5 Closure	372
8.5 Method of Fractional Steps	271	10.6 Problems	373
8.6 Closure	273	Appendix	
8.7 Problems	274	A.1 Empirical Determination of the Execution Time of Basic Operations	375
9. Linear Convection-Dominated Problems	276	A.2 Mass and Difference Operators	376
9.1 One-Dimensional Linear Convection Equation	277	References	381
9.1.1 FTCS Scheme	277	Subject Index	389
9.1.2 Upwind Differencing and the CFL Condition	280	Contents of Computational Techniques for Fluid Dynamics 2 Specific Techniques for Different Flow Categories	397
9.1.3 Leapfrog and Lax-Wendroff Schemes	281		
9.1.4 Crank-Nicolson Schemes	283		
9.1.5 Linear Convection of a Truncated Sine Wave	284
