Preface	xv
1. Intracule Functional Theory	1
<i>Deborah L. Crittenden and Peter M.W. Gill</i>	
1.1 Introduction . . . . .	2
1.2 Intracules . . . . .	3
1.3 Electron Correlation Models . . . . .	13
1.4 Dynamic and Static Correlation . . . . .	16
1.5 Dispersion Energies . . . . .	18
1.6 Future Prospects . . . . .	21
Bibliography . . . . .	22
2. Explicitly Correlated Electronic Structure Theory	25
<i>Frederick R. Manby</i>	
2.1 Introduction . . . . .	25
2.1.1 Basis-set expansions . . . . .	25
2.2 F12 Theory . . . . .	28
2.2.1 MP2-F12 . . . . .	29
2.2.2 Explicitly correlated coupled-cluster theory . . . . .	30
2.3 Five Thoughts for F12 Theory . . . . .	31
2.3.1 Thought 1: Do we need (products of) virtuals? . . . . .	31
2.3.2 Thought 2: Are there better two-electron basis sets? . . . . .	34

2.3.3	Thought 3: Do we need the resolution of the identity? . . . . .	35
2.3.4	Thought 4: Could we have explicit correlation for higher excitations? . . . . .	38
2.3.5	Thought 5: Can we avoid three-electron errors in two-electron systems? . . . . .	39
2.4	Conclusions . . . . .	40
	Bibliography . . . . .	40
3.	Solving Problems with Strong Correlation Using the Density Matrix Renormalization Group (DMRG)	43
	<i>Garnet Kin-Lic Chan and Sandeep Sharma</i>	
3.1	The Problem of Strong Correlation . . . . .	43
3.2	The Density Matrix Renormalization Group Wavefunction . . . . .	46
3.3	Locality and Entanglement in the DMRG . . . . .	47
3.4	Other Properties of the DMRG . . . . .	50
3.5	Relation to the Renormalization Group . . . . .	51
3.6	Dynamic Correlation — the Role of Canonical Transformations . . . . .	53
3.7	What Can the DMRG Do? A Brief History . . . . .	54
3.8	The Future: Higher Dimensional Analogues . . . . .	57
	Bibliography . . . . .	59
4.	Reduced-Density-Matrix Theory for Many-electron Correlation	61
	<i>David A. Mazzotti</i>	
4.1	Introduction . . . . .	62
4.2	Variational 2-RDM Method . . . . .	63
4.2.1	Energy as a 2-RDM functional . . . . .	63
4.2.2	Positivity conditions . . . . .	64
4.2.3	Semidefinite programming . . . . .	67
4.2.4	Applications . . . . .	69
4.3	Contracted Schrödinger Theory . . . . .	73
4.3.1	ACSE and cumulant reconstruction . . . . .	74
4.3.2	Solving the ACSE for ground and excited states . . . . .	75
4.3.3	Applications . . . . .	77
4.4	Parametric 2-RDM Method . . . . .	80
4.4.1	Parametrization of the 2-RDM . . . . .	81

4.4.2	Applications . . . . .	83
4.5	Looking Ahead . . . . .	85
	Bibliography . . . . .	87
5.	Finite Size Scaling for Criticality of the Schrödinger Equation	91
	<i>Sabre Kais</i>	
5.1	Introduction . . . . .	92
5.2	Criticality for Large-dimensional Models . . . . .	93
5.3	Finite Size Scaling: A Brief History . . . . .	95
5.4	Finite Size Scaling for the Schrödinger Equation . . . . .	97
5.5	The Hulthen Potential . . . . .	100
5.5.1	Analytical solution . . . . .	100
5.5.2	Basis set expansion . . . . .	101
5.5.3	Finite element method . . . . .	101
5.5.4	Finite size scaling results . . . . .	102
5.6	Finite Size Scaling and Criticality of M-electron Atoms . . . . .	105
5.7	Conclusions . . . . .	107
	Bibliography . . . . .	108
6.	The Generalized Sturmian Method	111
	<i>James Avery and John Avery</i>	
6.1	Description of the Method . . . . .	111
6.1.1	The introduction of Sturmians into quantum theory . . . . .	111
6.1.2	Generalized Sturmians . . . . .	114
6.1.3	The generalized Sturmian method applied to atoms . . . . .	117
6.1.4	Goscinskian configurations . . . . .	118
6.1.5	Goscinskian secular equations for atoms and atomic ions . . . . .	120
6.2	Advantages: Some Illustrative Examples . . . . .	120
6.2.1	The large-Z approximation: restriction of the basis set to an $\mathcal{R}$ -block . . . . .	121
6.2.2	Validity of the large-Z approximation . . . . .	126
6.2.3	Core ionization energies . . . . .	129
6.3	Limitations of the Method; Prospects for the Future . . . . .	130
6.3.1	Can the generalized Sturmian method be applied to $N$ -electron molecules? . . . . .	133

6.4	Discussion . . . . .	137
	Bibliography . . . . .	139
7.	Slater-Type Orbital Basis Sets: Reliable and Rapid Solution of the Schrödinger Equation for Accurate Molecular Properties	141
	<i>Philip E. Hoggan</i>	
7.1	Introduction . . . . .	142
7.1.1	Context of this chapter . . . . .	142
7.1.2	Atomic orbitals . . . . .	144
7.1.3	Problems to be solved when using Slater-type orbitals . . . . .	145
7.1.4	Strategy for Slater basis sets . . . . .	147
7.2	Some Dates: The Story So Far of Slater-Type Orbitals . . . . .	148
7.3	Computer Programs Using Slater-Type Orbitals . . . . .	149
7.3.1	Numerical grid methods . . . . .	151
7.3.2	Configuration interaction . . . . .	151
7.4	Slater Orbitals and Gaussian Orbitals . . . . .	151
7.5	Types of Exponentially Decaying Orbitals, Based on Eigenfunctions for One-Electron Atoms . . . . .	154
7.5.1	Orbitals which are linear combinations of Slater-type orbitals . . . . .	155
7.6	Types of Integral Over Slater Orbitals . . . . .	156
7.6.1	One-electron integrals . . . . .	156
7.6.2	Two-electron integrals . . . . .	157
7.6.3	Three- and four-electron integrals . . . . .	158
7.7	Integration Methods in the Literature . . . . .	158
7.7.1	Single-center expansion . . . . .	159
7.7.2	Gaussian expansion . . . . .	160
7.7.3	Gaussian transform method . . . . .	160
7.7.4	Fourier-transform method . . . . .	160
7.7.5	Use of Sturmians . . . . .	161
7.7.6	Elliptic coordinate method . . . . .	161
7.7.7	Monte Carlo integration . . . . .	162
7.8	General Two-Electron Exponential Type Orbital Integrals in Poly-Atomics Without Orbital Translations	163
7.8.1	Introduction . . . . .	163
7.8.2	Basis sets . . . . .	164

7.8.3	Programming strategy . . . . .	164
7.8.4	Avoiding ETO translations for two-electron integrals over three- and four-centers . . . . .	165
7.8.5	Numerical results of Coulomb resolutions: efficiency . . . . .	167
7.8.6	Perspectives and conclusions . . . . .	169
7.8.7	Angular momentum relations . . . . .	171
7.9	When are Slater-Type Orbitals Advantageous?	
	Some Applications . . . . .	171
7.9.1	The NMR nuclear shielding tensor . . . . .	171
7.9.2	Explicitly correlated methods for molecules .	176
7.9.3	Trial wave-functions for quantum Monte Carlo simulations over STO . . . . .	178
7.10	Highly Accurate Calculations Using STOs . . . . .	181
7.11	Closing Remarks . . . . .	181
7.12	Appendix A: How STOs were Translated: Products on Two Atoms . . . . .	183
	7.12.1 Review of BCLFs . . . . .	184
7.13	Appendix B: Brief Time-Line of Events in Molecular Work Over Slater-Type Orbitals to Date . . . . .	186
7.14	Appendix C: Main Results of Podolanski's Paper of 1931 with Additional Comments . . . . .	187
7.15	Appendix D: Potentials and Auxiliary Overlaps for Coulomb Resolution . . . . .	189
7.16	Appendix E: Analysis of Nuclear Dipole Integrals for NMR in a Slater Basis . . . . .	191
	Acknowledgements . . . . .	193
	Bibliography . . . . .	194
8.	Modern <i>Ab Initio</i> Valence Bond Methods	201
	<i>Philippe C. Hiberty and Sason Shaik</i>	
8.1	Basic Principles and Survey of Modern Methods . . . . .	202
	8.1.1 VB vs. MO wave functions in the two-electron/two-center case . . . . .	202
	8.1.2 Writing VB functions beyond the two-electron/two-center case . . . . .	205
	8.1.3 Some landmark improvements of the early VB method . . . . .	206

8.2	Strengths of the Valence Bond Approach . . . . .	211
8.2.1	Interpretability combined with accuracy of the wave functions . . . . .	211
8.2.2	A simple solution to the symmetry dilemma .	213
8.2.3	Calculations of diabatic energy curves along a reaction coordinate . . . . .	214
8.2.4	Quantitative evaluation of common chemical paradigms . . . . .	218
8.3	Present Capabilities and Expected Improvements . . .	224
8.3.1	Evaluation of Hamiltonian matrix elements .	224
8.3.2	Direct VBSCF/BOVB algorithm . . . . .	224
8.3.3	Current calculations of medium-sized molecular systems . . . . .	225
8.3.4	Mixed Valence Bond — Quantum Monte Carlo methods . . . . .	225
8.3.5	Prospective . . . . .	226
8.4	Concluding Remarks . . . . .	228
8.5	Appendix A: The Myth of “VB failures” . . . . .	229
8.6	Appendix B: Some Available VB Software Packages . . . . .	230
8.6.1	The XMVB program . . . . .	230
8.6.2	The TURTLE software . . . . .	230
8.6.3	The VB2000 software . . . . .	230
8.6.4	The CRUNCH software . . . . .	231
	Bibliography . . . . .	231
9.	Quantum Monte Carlo Approaches for Tackling Electronic Correlation	237
	<i>Massimo Mella and Gabriele Morosi</i>	
9.1	Introduction . . . . .	238
9.2	Variational Monte Carlo (VMC): A Possible Way Toward Explicitly Correlated Electronic Wave Functions . . . . .	239
9.2.1	Numerical integrals in VMC . . . . .	241
9.2.2	Optimization of trial wave functions . . . . .	247
9.2.3	Analytical forms for trial wave functions $\Psi_T$ . . . . .	252
9.3	Diffusion Monte Carlo: How to Extract the Best Information from Inaccurate Wave Functions . . . . .	254

9.3.1	Generalities . . . . .	254
9.3.2	Improved projectors . . . . .	258
9.3.3	DMC, state symmetry and excited states . . . . .	259
9.4	Computing Observables Different from State Energy . . . . .	261
9.4.1	Exact calculation of position dependent observables . . . . .	261
9.4.2	Calculation of atomic forces in VMC/DMC . . . . .	262
9.4.3	Computing the expectation value of ultra-local operators: electron and spin density on nuclei . . . . .	264
9.5	Conclusions . . . . .	266
	Bibliography . . . . .	268
10.	Solving the Schrödinger Equation on Real-Space Grids and with Random Walks	271

*Thomas L. Beck and Joel H. Dedrick*

10.1	Introduction . . . . .	272
10.2	Solving the Schrödinger Equation Using Grids in Real Space . . . . .	275
10.2.1	Basics of grid methods . . . . .	275
10.2.2	Multiscale (multigrid) approaches . . . . .	279
10.3	New Ways of Thinking about Large-Scale Solutions . . . . .	282
10.3.1	An encounter with Silicon valley . . . . .	283
10.3.2	The Borg-ing of computation . . . . .	283
10.3.3	The world's least efficient computer (yours) . . . . .	283
10.3.4	The world's most efficient computer (also yours) . . . . .	284
10.3.5	The end of a 20-year free ride . . . . .	285
10.3.6	Can we change sides? . . . . .	286
10.3.7	Algorithm desiderata for the massively parallel future . . . . .	286
10.3.8	What are we looking for? . . . . .	288
10.4	Random Walks for Solving the Schrödinger Equation . . . . .	292
10.4.1	Traditional diffusion quantum Monte Carlo . . . . .	292
10.4.2	Another angle . . . . .	296
10.4.3	Stochastic differential equations and the Feynman–Kac approach . . . . .	298

10.4.4	Obtaining $E(x,y)$ ? . . . . .	302
10.4.5	A pipe dream . . . . .	305
10.5	Summary . . . . .	306
	Bibliography . . . . .	307
11.	Changes in Dense Linear Algebra Kernels: Decades- Long Perspective	313
	<i>Piotr Luszczek, Jakub Kurzak, and Jack Dongarra</i>	
11.1	The Schrödinger Connection . . . . .	313
11.2	A Stroll Down the Memory Lane . . . . .	315
11.3	A Decompositional Approach . . . . .	318
11.4	Vector Processors . . . . .	319
11.5	RISC Processors . . . . .	322
11.6	Clusters . . . . .	325
11.7	Multicore Processors . . . . .	332
11.8	Multicore Processors Redux . . . . .	334
11.9	Error Analysis and Operation Count . . . . .	338
11.10	Future Directions for Research and Hardware Design .	339
	Bibliography . . . . .	341
	Index	343
