A PERTURBED ATOM

Contents

1 Introduction. Atomic Processes in Astrophysics **3**

1.1 Atomic and radiative processes in astrophysics 3

1.2 Some astrophysical applications 5

1.3 General characteristics of radiation processes 9

1.3.1 Main mechanisms of radiation emission 9

1.3.2 Interrelation between radiation and matter . . 11

1.3.3 Radiative emission and volume plasma radiative losses 13

1.4 Radiation imprisonment and plasma RL in the general case 15

1.5 A conception of perturbed atoms. The subject of the book 18

1.6 Nonhydrogenic atoms. Allowed and forbidden transitions. Properties of multicharged ions spectra 22

1.6.1 Nonhydrogen atomic spectral structure. Allowed and forbidden transitions 22

1.6.2 Properties of multicharged ions (MCI) spectra 24

1.6.3 Auto-ionization states 29

1.6.4 The interaction of discrete states with a continuum. Fano and Kompaneets descriptions . . 30

1.7 Rydberg atomic states in plasmas 34

2 Radiative Transitions in an Atomic Potential **35**

2.1 Classical radiation spectra in a Coulomb field. Peculiarities of the high-frequency domain. Kramers electrodynamics 35

2.2 Spectral line radiation (LR) probabilities 43

2.3 Photorecombination (PhR) cross section 48

2.4 Symmetry properties of the Coulomb field 56

2.5 General properties of quasiclassical radiative transition probabilities 61

2.6 Matrix elements between highly excited atomic states. Dipole radiative transitions in a hydrogen atom 65
2.7 A quasiclassical quantum defect method 72

3 Polarization of Atoms. Polarization Radiation and Light Scattering 79
3.1 Polarizabilities of atomic states 79
3.1.1 General relationships 79
3.1.2 Static polarizability 81
3.1.3 Resonance and high frequency polarizabilities . 82
3.2 A dynamic polarizability of Rydberg atomic states in the Kramers approximation 84
3.3 Statistical theory of an atomic polarizability 88
3.3.1 A dynamical polarizability of atoms in statistical plasma models 88
3.3.2 Local plasma frequency approximation 95
3.4 Polarization radiation 98
3.4.1 A general consideration 98
3.4.2 A polarization recombination 101
3.4.3 Polarization bound-bound radiative transitions. A conclusion 108
3.5 Compton light scattering 110

4 Atom in a Static Electric Field 115
4.1 Quasiclassical results for transition probabilities and lifetimes in parabolic coordinates 115
4.1.1 Introductory comments 115
4.1.2 Hydrogen-like atoms in an electric field. General relationships 118
4.1.3 Radiative lifetimes of states 122
4.2 Intensities of Stark components 126
4.3 Weak fields. Asymptotic theory of the decay of an atom 131
4.4 Classical theory of the decay of an atom in an electric field 133
4.5 Decay of states near the critical value of an electric field 135

4.6 General theory of atomic states in an electric field . . 138
4.6.1 Basis of the semiclassical approach 138
4.6.2 Energy levels 140
4.6.3 Decay rates 141
4.7 Results of numerical calculations 143

5 Atom in a Magnetic Field and Crossed F-B Fields 145
5.1 Introductory remarks. Energy spectrum of low lying atomic states 145
5.1.1 Energy spectrum of lower states 147
5.2 Adiabatic theory for highly excited atomic states in a strong magnetic field 152
5.3 "Latent" symmetry of an atom in a magnetic field . . 155
5.4 Oscillator strengths of atomic transitions in strong magnetic fields 163
5.5 Classical trajectories of an atomic electron in a magnetic field. Stochastization effects 167
5.5.1 Calculation of classical trajectories 167
5.5.2 Stochastization of electron motion in Coulomb and magnetic fields 171
5.5.3 Numerical calculations of spectra of an atom in a magnetic field 174
5.6 Hydrogen atom in crossed electric and magnetic fields 175
5.6.1 First-order theory 175
5.6.2 Second-order corrections 178
5.6.3 Atom in electric and strong magnetic fields . . 180
5.7 Expansion in inverse powers of principle quantum numbers 183
5.8 Conclusions 187

6 Atom in a Variable Electric Field 187
6.1 The types of oscillating fields and features of resonance conditions in plasmas 187
6.2 The Blokhintsev spectrum 192
6.3 Hydrogen atom in a rotating electric field 195
6.4 Multiphoton transitions in a two-level system 198

6.5 The quasi-energy spectrum of a two-level system. Intensities of satellites 201
6.6 Action of weak oscillating electric fields of broad spectral composition on the atom 209
6.7 Hydrogen atom in static (S) and strong oscillating (dynamic-D) fields. Numerical solutions for the case when $\mathbf{S} \perp \mathbf{D}$ 215
6.8 Analytical theory of multiquantum resonances in $\mathbf{S} - \mathbf{D}$ fields 219
6.9 Hydrogen spectral line structure near resonances in $\mathbf{S} - \mathbf{D}$ fields 228
6.10 On the stochastization of highly excited electron motion in a periodic field 232

7 Atom under Influence of Stochastic Perturbations 234
7.1 An atom under the action of Markoff-type perturbations 234
7.1.1 A general formulation of the problem. Approximate solutions for weak and strong perturbations 234
7.1.2 Precise solutions for model perturbations. The model microfield method (MMM) 237
7.2 An electron in Planck radiation field. "Infrared catastrophe" 243
7.2.1 Classical current approximation 243
7.2.2 Multiphoton induced processes in a Planck radiation field 246
7.2.3 Calculation of the absorbed energy 252
7.3 Model of Brownian motion and optical phenomena. Path integral method 255
7.3.1 The state amplitude method and the path integration 255
7.3.2 Investigation of nonlinear effects in absorption due to Brownian fluctuations of atomic velocity 261

8 Relaxation and Decay of Atomic States 265

8.1 Resonance of discrete states against the background of a continuous spectrum 265
8.1.1 A number of discrete states against the background of one continuum 265
8.1.2 Several continua. Scattering problems 268
8.1.3 Two-level problem with stationary perturbation 270
8.2 Damping of atomic states due to their relaxation in plasmas 275
8.2.1 Impact relaxation of atomic levels 275
8.2.2 Features of the spectral line shape under impact relaxation of atomic sublevels in ion field . 279
8.3 Emission of forbidden spectral lines and decay of metastable levels in plasmas 282
8.3.1 The polarizational mechanism for forbidden transitions in an atom 282
8.3.2 Interrelation between nonelastic and polarization mechanisms. The Weisskopf mechanism for inelastic transitions 286
8.3.3 The adiabatic approximation for polarization radiation 290
8.4 Decay of atomic states and some elementary process in plasmas 292
8.4.1 Transition discrete spectrum - continuum in hydrogenic plasmas 292
8.4.2 Charge exchange of atoms at multicharged ions as a decay process 294
8.4.3 Auto-ionization decays and dielectronic recombination in plasmas 296
8.5 Ionization of atomic states in a strong low frequency field 297

9 Excited Hydrogen-Like Atom in Electric Fields of Charged Particles. Foundation of Classical and Quantum Spectral Line Broadening Theory 301
9.1 The atomic state evolution in the electric field of a classically moving charged particle 302

9.2 Effect of the hydrogenic state mixing during charge exchange of an atom at the multicharged ion 307
9.3 Quantum motion of an electron in an electric field of hydrogen-like atom or ion. Connection with the line-broadening problem 312
9.3.1 Classical and quantum formulations of the problem of electron interaction with an excited atom 312
9.3.2 The system of wave functions of an excited hydrogen atom and a broadening particle 312
9.3.3 The hydrogen line shape and the overlap integral of the wave functions of a broadening particle 316
9.3.4 Generalization onto the case of hydrogen-like ions 319
9.4 Differential cross sections for electron and ion scattering at the excited hydrogen atom. Precise solutions . . 323

10 Quasiclassical Theory of Atom - Charge Particle Collisions 328
10.1 Model of equivalent photons (EPh) 328
10.2 Excitation by electron impact as absorption of equivalent photons by an ion 331
10.3 Dielectronic recombination as the resonance fluorescence of equivalent photons 334
10.4 Polarization radiation as non-resonant scattering of equivalent photons 339
10.5 Quasiclassical matrix elements for inelastic transitions in Born approximation 346

11 Collision of the Atom with Atomic Particles in External Fields 353
11.1 Collisional transitions between thin structure sublevels of a hydrogen atom in magnetic field 354
11.2 Collisions of two-level atom with particles in strong resonant electromagnetic field 357
11.2.1 Optical collisions. The basic system of equations 358

11.2.2 Optical collisions and characteristics of light absorption media 362
11.3 Landau-Zener mechanism of strong electromagnetic radiation absorption in the wings of a spectral line . . . 364
11.3.1 Landau-Zener model for optical phenomena . . 364
11.3.2 Nonlinear effects in absorption for the collision of identical atoms 366
11.3.3 Experimental aspects 374
11.4 Multiparticle effects. The change of the atom quantization direction in a laser field 375
11.4.1 Multiparticle approach to the powerful radiation absorption by the atom in a plasma 375
11.4.2 Spectra calculation in a laser field 376
11.4.3 The change of the atom quantization direction in a laser field 382
11.5 Radiative collisions 386
11.6 Effect of electric microfield on resonant charge exchange in a dense medium 390

12 Atomic Kinetics **394**
12.1 Kramers electrodynamics and radiative cascades between Rydberg atomic states 394
12.1.1 Classical kinetic equation 396
12.1.2 Quantum kinetic equation in the quasiclassical approximation 398
12.1.3 Relationship of the quasiclassical solution to the quantum cascade matrix. The solution in the general quantum case 403
12.1.4 Atomic level populations for a photorecombinative source. Quasiclassical scaling laws . . . 407
12.2 Unified radiative-collisional kinetic model for Rydberg atomic states 413
12.3 An universal approach to an atomic state population kinetics in plasmas 416
12.4 General problems of atomic-states mixing in a plasma medium. Density matrix method 423
12.4.1 Density matrix method 423

12.4.2 Interference of atomic states in an ion field. A general kinetic equation for atomic density matrix 428
