PREFACE TO THE DOVER EDITION VII

PREFACE TO VOLUME I IX

PREFACE TO THE FIRST EDITION XI

ERRATUM XIX

I. GENERAL CONSIDERATIONS

1.1	Introductory remarks	1
1.2	General features of hypersonic flow fields	3
1.3	Assumptions underlying inviscid hypersonic theory	8
1.4	The normal shock wave	11
1.5	Oblique and curved shocks	21
1.6	Mach number independence principle	24
1.7	General strip theory	26
1.8	Dissipative effects	28

II. SMALL-DISTURBANCE THEORY

2.1	Introduction and basic equations	32
2.2	Hypersonic similitude	39
2.3	Unified supersonic-hypersonic similitude	45
2.4	Slender-body strip theory	47
2.5	Examples of small-disturbance solutions	50
2.6	Similar power-law solutions	55
2.7	Application of similar solutions to steady flows	74
2.8	Slightly blunted slender bodies	92
2.9	Large incidence and correlation of similitudes	103
2.10	Unsteady flow theory	113
2.11	Nonequilibrium effects	116

III. NEWTONIAN THEORY

3.1	The gasdynamics of Sir Isaac Newton	129
3.2	Two-dimensional and axisymmetric bodies	133
3.3	Simple shapes and free layers	139

3.4 Optimum shapes	152
3.5 Shock layer structure and cross flow phenomena	169
3.6 Shock layer structure with cross flow	179
3.7 Conical flow	190
3.8 Bodies of revolution at small incidence	201
3.9 Unsteady flow	206

IV. CONSTANT-DENSITY SOLUTIONS

4.1 The wedge	217
4.2 The cone	224
4.3 Circular cylinder	232
4.4 The sphere	245
4.5 Solutions with cross flow	254

V. THE THEORY OF THIN SHOCK LAYERS

5.1 Basic concepts	264
5.2 Successive approximation schemes	272
5.3 Constant-streamtube-area approximation	280
5.4 Two-dimensional and axisymmetric blunt-faced bodies	298
5.5 Quasi wedges and quasi cones	320
5.6 Conical bodies	323
5.7 General blunt-faced bodies and related similitudes	342
5.8 Integral methods	355
5.9 Newtonian separation	366
5.10 Nonequilibrium flows	380

VI. NUMERICAL METHODS FOR BLUNT-BODY FLOWS

6.1 Nature of the problem	391
6.2 Streamtube-continuity methods	402
6.3 Method of integral relations and polynomial approximation	407
6.4 Relaxation techniques and the unsteady approach method	438
6.5 The inverse problem	448
6.6 Procedures with nonequilibrium	472

VII. OTHER METHODS FOR LOCALLY SUPERSONIC FLOWS

7.1 Method of characteristics	480
7.2 Shock-expansion theory	497
7.3 Tangent-wedge and tangent-cone	522

7.4 Conical flows	526
7.5 Nonequilibrium flows	536
Cited References	545
