<i>Notations and conventions</i>	xiii
1. Elements of nuclear structure	1
1.1 Introduction	1
Exercises	5
1.2 Nuclear structure from gross properties	5
Exercises	7
1.3 Nuclear shell structure	8
1.3.1 Differences in binding energies and radii	10
1.3.2 Nucleon transfer reactions and spectroscopy	12
1.3.3 The shell model	15
Exercises	24
1.4 Pairing in nuclei	24
Exercises	32
1.5 Singly-closed shell nuclei	32
Exercises	37
1.6 Open-shell nuclei: nuclear deformation	38
1.6.1 Even open-shell nuclei	38
1.6.2 Odd open-shell nuclei	44
Exercises	48
1.7 Low-energy collective structure in doubly-even nuclei	48
1.7.1 The harmonic vibrator model	49
1.7.2 The rotor model	52
1.7.3 Low-energy vibrational states in doubly-even nuclei	55
1.7.4 Rotational states in doubly-even nuclei	65

Exercises	74
1.8 Low-energy collective structure in odd nuclei	76
Exercises	85
1.9 Shape coexistence in nuclei	86
Exercises	92
1.10 Nuclear structure at high excitation energy	93
2. The Bohr collective model	97
2.1 Coordinates and observables	98
2.1.1 Quadrupole moments as collective coordinates	98
2.1.2 Spherical polar coordinates	99
2.1.3 Canonical momenta and momentum operators	103
2.1.4 Other observables of the collective model	103
Exercises	104
2.2 The volume element and Laplacian	105
2.2.1 The metric tensor	106
2.2.2 The Laplacian for \mathbb{R}^5 in terms of collective coordinates	107
Exercises	111
2.3 Solvable submodels of the Bohr collective model	111
2.3.1 The harmonic spherical vibrator submodel	112
2.3.2 The Wilets-Jean submodel	117
2.3.3 The rigid-rotor submodel	120
Exercises	128
2.4 The adiabatic Bohr model	129
2.4.1 The adiabatic Hamiltonian	130
2.4.2 E2 moments and transitions in the adiabatic limit	131
2.4.3 Beta and gamma vibrations of a triaxial rotor	131
2.4.4 Beta and gamma vibrations of an axially symmetric rotor	134
2.4.5 Comparison of the adiabatic Bohr model predictions with experiment	137
Exercises	140
2.5 Conclusions and implications	141
3. Symmetry, dynamical groups and spectrum generating algebras	143
3.1 Symmetry groups	143
3.2 Dynamical groups	144
Exercise	145
3.3 Dynamical subgroup chains	145
3.4 Lie algebras of physical observables	146
3.5 The Lie algebra of a Lie group	148
Exercises	149
3.6 Spectrum generating algebras	149

Exercise	150
3.7 Irreps of Lie algebras with raising and lowering operators	150
3.7.1 The Heisenberg-Weyl algebra, $hw(1)$	150
3.7.2 The angular momentum algebras, $so(3)$ and $su(2)$	152
3.7.3 The $su(1,1)$ Lie algebra	154
Exercises	157
3.8 Casimir operators	157
Exercise	158
3.9 Irreps of Lie groups	158
3.10 Compact and non-compact groups	159
Exercise	160
3.11 Unitary representations as quantizations	160
4. The algebraic collective model	163
4.1 The harmonic oscillator basis for the Bohr model	163
4.1.1 The Heisenberg-Weyl algebra, $hw(5)$	164
4.1.2 The unitary group $U(5)$ and its $u(5)$ Lie algebra	165
4.1.3 The orthogonal group $O(5)$ and its $so(5)$ Lie algebra	167
4.1.4 The rotation group $SO(3)$ and its $so(3)$ Lie algebra	170
Exercises	170
4.2 Algebraic and geometric structure of the ACM	171
4.2.1 Factorisation of the Bohr model Hilbert space	171
4.2.2 The $su(1,1)$ Lie algebra and its harmonic series irrep	173
4.2.3 The modified oscillator series of $SU(1,1)$ irreps	176
Exercises	180
4.3 Dynamical groups and symmetries of solvable submodels	180
4.3.1 The harmonic spherical vibrator submodel	182
4.3.2 Wilets-Jean submodels	183
4.3.3 Rotor submodels	184
4.3.4 The general ACM	185
4.3.5 The adiabatic limit	186
Exercises	187
4.4 Beta matrix elements for the ACM	187
4.4.1 Summary of beta matrix elements	187
4.4.2 Beta matrix elements from the $su(1,1)$ irreps	189
4.4.3 Beta matrix elements from the factorisation method	190
Exercises	192
4.5 $SO(5)$ matrix elements	193
4.5.1 The Wigner-Eckart theorem for $SO(5)$	193
4.5.2 $SO(5)$ spherical harmonics as basis wave functions	194
4.5.3 $SO(5)$ Clebsch-Gordan coefficients and their symmetries	195
4.5.4 $SO(5)$ -reduced matrix elements	197

Exercises	199
4.6 Combined matrix elements	200
4.6.1 Matrix elements in a harmonic spherical vibrator basis . . .	201
4.6.2 Matrix elements in general modified oscillator series irreps .	202
4.6.3 Reduced E2 transition rates between states of good SO(5) seniority	203
Exercise	205
4.7 Collective model calculations	205
4.7.1 Choice of a basis	206
4.7.2 Calculations for an SO(5)-invariant Wilets-Jean model . . .	206
4.7.3 A possible nuclear application	212
4.7.4 Calculations for a beta-rigid Hamiltonian	214
4.7.5 Calculations for beta- and gamma-dependent potentials . .	215
Exercises	219
4.8 Successes and limitations of the Bohr model	219
4.9 The computation of SO(5) spherical harmonics and Clebsch-Gordan coefficients	222
4.9.1 An algorithm for computing SO(5) spherical harmonics . .	223
4.9.2 Computation of SO(5) Clebsch-Gordan coefficients	228
Exercises	231
5. The shell model	233
5.1 Introduction	233
5.2 The representation of antisymmetric states	236
5.2.1 Slater determinants	237
5.2.2 Fermion creation and annihilation operators	238
5.2.3 Neutrons and protons	239
5.2.4 Operators on Fock space	240
Exercises	243
5.3 Upper and lower indices	243
Exercises	246
5.4 One-body unitary transformations	246
5.4.1 The Pauli and Schwinger representations of $u(2)$	247
5.4.2 Representation of the unitary transformations of $\mathbb{H}^{(1)}$. . .	248
Exercises	249
5.5 Isospin in nuclear physics	250
5.5.1 Relationship with exchange symmetry	250
5.5.2 Coulomb energies and the isobaric multiplet mass equation	252
5.5.3 Isospin multiplets	252
5.5.4 Isobaric analog states in the continuum	257
5.5.5 Isospin symmetry and gamma-decay selection rules	257
Exercises	259

5.6	Nucleon-nucleon interactions	260
5.6.1	The bare nucleon-nucleon interaction	261
5.6.2	Nucleon scattering phase shifts	263
	Exercise	265
5.7	Effective interactions and operators for the shell model	266
5.7.1	A zero-order effective interaction	267
5.7.2	Principles of effective operator theory	269
5.7.3	Non-singular two-nucleon interactions	271
5.7.4	Effective operators for the many-nucleon shell-model	279
5.7.5	The no-core shell model (NCSM)	289
5.7.6	Realistic effective interactions in medium and heavy nuclei	294
5.7.7	Importance of effective interaction theory	295
	Exercises	297
5.8	Harmonic oscillator states and symmetries	298
5.8.1	The simple harmonic oscillator (SHO)	299
5.8.2	The spherical harmonic oscillator	303
5.8.3	The $U(3)$ symmetry group	311
5.8.4	The $Sp(3, \mathbb{R})$ dynamical group	312
	Exercises	313
5.9	Transformation to relative and centre-of-mass coordinates	315
	Exercises	323
5.10	Dual pairs of group representations	324
5.11	The unitary and symmetric groups	326
5.11.1	Schur-Weyl duality	326
5.11.2	Dual $S_N \times U(d)$ representations	328
5.11.3	Classification of S_N and $U(d)$ irreps by Young diagrams	332
5.11.4	Dimensions of S_N and $U(d)$ irreps	335
5.11.5	Unitary-unitary duality	336
5.11.6	Tensor products of unitary representations	339
5.11.7	Gel'fand-Tsetlin bases	341
5.11.8	$U(d) \downarrow U(n) \times U(d-n)$ and $U(d) \downarrow SU(d)$ branching rules	342
5.11.9	Factorisation as the inverse of multiplication	344
5.11.10	Space symmetry; plethysms	345
5.11.11	Casimir invariants of unitary Lie algebras	348
	Exercises	350
5.12	Orthogonal and compact symplectic groups	351
5.12.1	The $so(3) \subset u(3)$ subalgebra	352
5.12.2	The $so(d) \subset u(d)$ subalgebra	353
5.12.3	The labelling of $SO(d)$ and $O(d)$ irreps	354
5.12.4	Highest-weight states for $O(d)$ irreps	355
5.12.5	Particle-hole symmetry	355
5.12.6	Littlewood's classification of $O(d)$ irreps	357

5.12.7	U(d) \downarrow O(d) branching rules	358
5.12.8	Modification rules for non-standard O(d) labels	361
5.12.9	O(d) \downarrow SO(d) branching rules	362
5.12.10	The USp($2d$) symplectic group	363
5.12.11	U($2d$) \downarrow USp($2d$) branching rules	365
5.12.12	Dimensions of O(d) and USp(d) irreps	366
5.12.13	Groups dual to O(d) and USp(d)	366
	Exercises	368
5.13	The classification of shell-model basis states	369
5.13.1	Nuclear jj coupling	369
5.13.2	Supermultiplet symmetry	373
5.13.3	LST and pair coupling	376
5.13.4	LST coupling in SU(3) and Sp(3, \mathbb{R}) bases	378
5.13.5	Competing coupling schemes	378
	Exercises	379
5.14	Coefficients of fractional parentage (cfp)	379
5.14.1	Cfp as SU(2)-reduced Clebsch-Gordan coefficients	380
5.14.2	Single-particle cfp as reduced matrix elements	381
5.14.3	Some properties of the single-particle cfp	383
5.14.4	Applications of single-particle cfp	385
5.14.5	Calculation of single-particle cfp	387
	Exercises	389
5.15	Successes and limitations of the shell-model	390
6.	Pair-coupling models	399
6.1	Introduction	399
6.2	Time-reversal and the su(2) quasi-spin algebra	402
6.2.1	The time-reversal operation	402
6.2.2	The su(2) quasi-spin algebra	403
	Exercises	404
6.3	The single-shell $J = 0$ pairing model	405
	Exercises	411
6.4	Multishell $J = 0$ pairing models	412
6.4.1	Two nucleons in many non-degenerate levels	412
6.4.2	The Richardson equations	415
6.4.3	Application of the Richardson equations	418
	Exercises	421
6.5	The shell model in jj coupling; singly-closed shell nuclei	422
6.5.1	The group U($2j + 1$) and its USp($2j + 1$) subgroup	423
6.5.2	Dual subgroup chains	424
6.5.3	Duality and branching rules	426
6.5.4	Implications of duality for transition matrix elements	427

6.5.5	General seniority-conserving single- j -shell models	429
6.5.6	Applications of a seniority-conserving model in jj coupling	434
6.5.7	Seniority-conserving Hamiltonians in multishell spaces	434
	Exercises	435
6.6	$J = 0, T = 1$ pairing in jj coupling; open-shell nuclei	438
6.6.1	The $U(2)_T$ isospin group	438
6.6.2	The group $\mathcal{SO}(5)$ dual to $USp(2j + 1)$	439
6.6.3	Classification of states	443
6.6.4	The ranges of the $\mathcal{SO}(5) \times USp(2j + 1)$ quantum numbers	443
6.6.5	The $so(5)$ Casimir invariant	444
6.6.6	The $\mathcal{SO}(5)$ pair-coupling model	445
6.6.7	General multishell seniority-conserving models	446
	Exercises	448
6.7	$L = 0, T = 0, 1$ pairing in LST coupling; open-shell nuclei	448
6.7.1	Single-nucleon operators and time reversal in LST coupling	449
6.7.2	The $L = 0$ pairing interaction for states of a single l value	450
6.7.3	An $so(8)$ spectrum generating algebra	451
6.7.4	The $O(2l + 1) \subset U(2l + 1)$ symmetry group dual to $\mathcal{SO}(8)$	452
6.7.5	Classification of states	455
6.7.6	Quantum number ranges from $U(d) \downarrow O(d)$ branching rules	455
6.7.7	Spectra of the $L = 0$ pair-coupling model	458
6.7.8	General multishell $L = 0$ seniority-conserving models	459
6.7.9	Concluding remark on $L = 0$ pairing	461
	Exercises	461
6.8	The BCS approximation	462
6.8.1	The BCS ground state as a quasi-particle vacuum	462
6.8.2	Bogolyubov-Valatin transformations as quasi-spin rotations	465
6.8.3	The BCS equations	466
6.8.4	The independent-quasi-particle (IQP) Hamiltonian	468
6.8.5	Interpretation of the BCS approximation	471
6.8.6	Comparisons with exact results for the one-level model	476
6.8.7	Improved BCS approximations	477
6.8.8	Normal and superconducting BCS solutions	479
	Exercises	480
6.9	Implications and applications of BCS theory	482
6.9.1	Ground states of even nuclei	482
6.9.2	Odd-even mass differences	482
6.9.3	The energy gap and collective two quasi-particle states	483
6.9.4	Electromagnetic matrix elements and pairing correlations	484
6.9.5	Transfer reactions and pairing correlations	485
	Exercises	490
6.10	BCS and exact results for a two-level model	491

6.10.1	The two-level model	491
6.10.2	BCS solutions for the two-level model	492
6.10.3	Exact solutions of the two-level model	493
6.10.4	The pairing phase transition in the two-level model	494
6.10.5	Analogy with shape vibrations and rotations	495
	Exercises	495
6.11	The number-projected coherent-state (NPCS) model	496
6.11.1	Coherent-state representation of pair-coupled states	497
6.11.2	Coherent-state representation of quasi-spin operators	499
6.11.3	Wave functions for quasi-particle vacuum states	500
6.11.4	Wave functions for number-projected seniority states	501
6.11.5	The BCS and number-projected BCS approximations	504
6.11.6	Number-projected states of arbitrary seniority	507
6.11.7	Application to a two-level model	510
	Exercises	512
7.	Mean-field approximations	513
7.1	Introduction	513
7.2	The Hartree mean-field approximation	515
	Exercise	516
7.3	Mean-field equations for indistinguishable fermions	516
	Exercise	519
7.4	Manifolds of Slater determinants	519
7.4.1	Slater determinants as particle-hole vacuum states	520
7.4.2	Slater determinants as coherent states	521
	Exercises	523
7.5	Normal-ordered expansions	523
	Exercises	525
7.6	The Hartree-Fock approximation	525
7.6.1	Self-consistent field equations	526
7.6.2	The Hartree-Fock variational equations	527
7.6.3	The residual interaction	528
7.6.4	Symmetry breaking in the Hartree-Fock approximation	529
7.6.5	The restoration of broken symmetries	531
7.6.6	The Skyrme-Levinson method	533
	Exercises	534
7.7	The Hartree-Fock-Bogolyubov approximation	534
7.7.1	Generalised quasi-particles and the fermion-pair algebra	534
7.7.2	Self-consistent field equations	535
7.7.3	The full Hamiltonian in terms of quasi-particle operators	537
7.7.4	The group of Bogolyubov-Valatin transformations	538
7.7.5	The manifold of quasi-particle vacuum states	539

7.7.6	The HFB variational equations	540
	Exercises	540
7.8	Constrained Hartree-Fock methods	541
7.9	Applications of mean-field models	541
7.9.1	Effective interactions for mean-field calculations	543
7.9.2	Calculations of nuclear properties	545
7.9.3	A potential application of generalised mean-field methods	549
8.	Time-dependent mean-field theory; a classical approximation	551
8.1	The equations of motion of constrained quantum mechanics	551
	Exercises	553
8.2	Small-amplitude normal-mode vibrations	554
8.2.1	Small-amplitude TDHF solutions	554
8.2.2	Small-amplitude vibrations of anharmonic oscillators	556
8.2.3	Interpretation of the small-amplitude TDHF vibrations	557
8.2.4	The Hartree-Fock stability condition	559
8.2.5	Broken symmetries, rotations, and moments of inertia	560
8.2.6	Moments of inertia for irrotational flow	562
	Exercises	564
8.3	Classical mechanics as constrained quantum mechanics	564
8.3.1	Phase spaces of coherent states	565
8.3.2	The choice of coherent states	567
8.3.3	Classical observables	569
8.3.4	Hamilton dynamics on $\overline{\mathcal{M}}$	569
	Exercises	570
8.4	Mean-field dynamics in an adiabatic expansion	570
8.4.1	Position and momentum coordinates	571
8.4.2	Potential and kinetic energies	571
8.4.3	Lagrangian equations of motion	572
8.4.4	The mass tensor as a Riemannian metric	573
8.5	Constrained mean-field methods	574
8.5.1	The self-consistent cranking-model	574
8.5.2	Mapping out energy surfaces	575
	Exercises	577
9.	Concluding remarks	579
Appendix A	Some basics of angular-momentum theory	583
A.1	Angular-momentum basis states	583
A.2	SU(2) coupling coefficients	583
A.3	Spherical tensor operators	587
A.3.1	The transformation of linear operators	587

A.3.2	Irreducible spherical tensors	588
A.3.3	The Wigner-Eckart theorem	588
A.4	Recoupling coefficients	589
A.4.1	Racah coefficients	590
A.4.2	9- <i>j</i> symbols	591
A.5	Examples of recoupling expressions	592
A.5.1	Reduced matrix elements for right-to-left coupling	592
A.5.2	Reduced matrix elements for left-to-right coupling	594
A.6	Covariant and contravariant tensors	596
A.7	Hermitian adjoints, covariant adjoints, and their reduced matrix elements	598
A.7.1	Covariant adjoints	598
A.7.2	Covariant and contravariant fermion operators	599
A.7.3	Reduced matrix elements of covariant adjoint tensors	600
A.8	Rotation matrices	600
A.8.1	Some properties of rotation matrices	601
A.8.2	The Wigner \mathcal{D} functions	602
	Exercises	604
Appendix B Useful relationships for electromagnetic properties of nuclei		607
B.1	General expressions	607
B.2	Weisskopf units	608
B.3	Electric quadrupole moments and transitions in the axially- symmetric rotor model	609
<i>Fundamental physical constants and conversion factors</i>		611
