Preface      xiii

Introduction      1

## O

Mathematical and Physical Preliminaries      5

<b>0-1 Scalars, Vectors, and Vector Algebra</b>	<b>5</b>
<b>0-2 The Representation of Fields</b>	<b>13</b>
<b>0-3 Static Force Fields</b>	<b>17</b>
<b>0-4 Coordinate-Free Definitions for the Gradient and the Curl</b>	<b>24</b>

## 1

Charge and Current: From Qualitative Recognition  
to Quantitative Measurement      33

<b>1-1 The Phenomenon of Electric Charge</b>	<b>34</b>
<b>1-2 The Interaction of Point Charges</b>	<b>35</b>
<b>1-3 The Phenomenon of Current</b>	<b>38</b>
<b>1-4 The Interaction of Parallel Currents</b>	<b>40</b>
<b>1-5 Current as Charge in Motion</b>	<b>41</b>
<b>1-6 Units in Electricity and Magnetism</b>	<b>42</b>

## 2

## Charge and Current: The Specification of Arbitrary Distributions 50

2-1 Charge Density	52
2-2 Current Density	54
2-3 Mathematical Digression I: Stokes' Theorem and The Divergence Theorem	61
2-4 The Equation of Continuity	69
2-5 Mathematical Digression II: Several Operators Involving $\nabla$	71

## 3

## The Electromagnetic Field: Its Definition and Its Effect on General Charge Distributions 74

3-1 Forces on Point Charges: A Definition of the Electromagnetic Field	75
3-2 Trajectories of Particles in Prescribed Fields	78
3-3 Forces and Torques on General Distributions in Prescribed Fields	83

## 4

## The Electric Field Produced by Static Charges 91

4-1 Coulomb's Law and the Electrostatic Field of Given Sources	91
4-2 Gauss's Law	102
4-3 The Restricted Faraday Law	109
4-4 The Electrostatic Potential	110
4-5 Energy in the Electrostatic Field	117
4-6 The Multipole Expansion of the Electrostatic Potential	120

## 5

## The Magnetic Induction Field Produced by Steady Currents 129

5-1 The Law of Biot-Savart	130
5-2 The Magnetic Flux Law	138
5-3 Ampere's Circuital Law	140
5-4 The Magnetic Vector Potential	145
5-5 Energy in the Static Magnetic Induction Field	150
5-6 The Multipole Expansion of the Magnetic Vector Potential	151

## 6

## The Electromagnetic Field Produced by Time-Dependent Charge Distributions: Maxwell's Equations in Vacuum 156

6-1 Electromagnetic Induction: Faraday's Law	157
6-2 A Contradiction and its Resolution: Displacement Current	170
6-3 Maxwell's Equations	172
6-4 Energy in the Electromagnetic Field	176
6-5 Momentum in the Electromagnetic Field	178
6-6 A Reformulation: Maxwell's Equations for the Potentials	179
6-7 Another Reformulation: Decoupling the Equations for the Fields	182

## Interlude: A Change of View 185

## 7

## Plane Electromagnetic Waves in Vacuum 187

7-1 Elementary Fields Depending on $z$ and $t$ ; Plane Electromagnetic Waves	188
7-2 Energy and Momentum in Plane Waves	193
7-3 Superposition of Waves of the Same Frequency: Polarization and Interference	195
7-4 Superposition of Waves of Different Frequencies; Spectral Decomposition	204
7-5 Plane Waves in Three Dimensions	207

## 8

## Potential Theory 213

8-1	Boundary Conditions	214
8-2	Superposition and Uniqueness	215
8-3	One-Dimensional Problems	218
8-4	Two-Dimensional Problems by Separation of Variables	218
8-5	Two-Dimensional Problems Using Complex Variables	228
8-6	The Method of Images	232
8-7	Numerical Solution of Laplace's Equation	236
8-8	Solution of Laplace's Equation by Experiment: The Method of Analogy	244
8-9	Poisson's Equation	245

## 9

Properties of Matter I:  
Conduction 249

9-1	Macroscopic Description: Conductivity and Ohm's Law	250
9-2	Microscopic Description: Carrier Mobility and Collision Times	254

## 10

Properties of Matter II:  
Dielectric Polarization 260

10-1	The Microscopic Description: Electric Polarizability	263
10-2	The Macroscopic Description: Dielectric Polarization	267
10-3	The Macroscopic Scalar Potential and Electric Field at a Point Exterior to a Polarized Dielectric	268
10-4	The Macroscopic Electric Field at a Point Interior to a Polarized Dielectric	272
10-5	The Basic Equations of Electrostatics when Dielectrics are Present	278
10-6	Connecting the Microscopic Polarizability with the Macroscopic Dielectric Constant: The Clausius-Mossotti Relation	285

## 11

Properties of Matter III:  
Magnetization 289

11-1	The Microscopic Description: Magnetic Polarizability	290
11-2	The Macroscopic Description: Magnetization	296
11-3	The Macroscopic Vector Potential and Magnetic Induction Field at a Point Exterior to a Magnetized Object; Bound Currents	297
11-4	An Alternative Approach to the Exterior Field: Equivalent Poles	305
11-5	The Macroscopic Magnetic Induction Field at a Point Interior to a Magnetized Object	307
11-6	The Basic Equations of Magnetostatics when Magnetically Responsive Matter is Present	310
11-7	Connecting the Microscopic Polarizability with the Macroscopic Relative Permeability	315
11-8	Ferromagnetism	317

## 12

Time-Dependent Fields When Matter Is Present:  
Maxwell's Equations Revised 325

12-1	Maxwell's Equations in Matter	326
12-2	The Equation of Continuity	329
12-3	The Energy Theorem	330
12-4	The Momentum Theorem	332
12-5	On Which Fields are Basic	333
12-6	The Potentials	333
12-7	Boundary Conditions at Discontinuities in the Medium	335
12-8	Static Potentials	342

## 13

Plane Electromagnetic Waves  
in Linear Matter 347

13-1	Maxwell's Equations for Monochromatic Fields in Linear Matter	348
13-2	Boundary Conditions on Monochromatic Fields	353
13-3	Plane Monochromatic Waves in Unbounded, Isotropic, Homogeneous, Linear Media	356
13-4	Transmission and Reflection at Plane Interfaces	363
13-5	Wave Guides and Cavity Resonators	378
13-6	Superposition of Waves of Different Frequency: Dispersion	387

14

Radiation from Prescribed Sources  
in Vacuum 399

14-1	The General Solution of the Inhomogeneous Wave Equation; Retardation	400
14-2	Radiation from Monochromatic Sources: The Oscillating Electric Dipole	403
14-3	The Liénard-Wiechert Potentials	408
14-4	The Fields of a Moving Point Charge	412
14-5	Radiation from Accelerated Point Charges	416
14-6	The Radiation Reaction	422

15

Relativistic Formulation  
of Maxwell's Equations 426

15-1	A Review of Special Relativity	430
15-2	Maxwell's Equations in Covariant Form; The Electromagnetic Field Tensor	438
15-3	Transformation of the Electromagnetic Field	443
15-4	The Stress-Energy-Momentum Tensor	445
15-5	A New Viewpoint: The Law of Biot-Savart Revisited	448

Appendices

A

Linear Equations, Determinants,  
and Matrices 459

A-1	Simultaneous Linear Equations and Determinants	459
A-2	Matrix Algebra	462

B

Binomial and Taylor Expansions 467

C

Vector Identities and Relationships 470

D

Complex Numbers and Fourier Analysis 472

D-1	The Algebra of Complex Numbers	472
D-2	Fourier Series	477
D-3	Fourier Transforms	479

E

Reference Tables 481

Answers to Selected Problems 483

Index 499
