

CONTENTS

Preface	v
Foreword	vii
Part I. Atoms and Molecules in Optical Lattices	1
1. Ultracold Ytterbium: Generation, Many-body Physics, and Molecules	3
<i>S. Sugawa, Y. Takasu, K. Enomoto and Y. Takahashi</i>	
1 Introduction	3
2 All-Optical Formation of Quantum Degenerate Gases of Ytterbium	6
2.1 A route toward quantum degeneracy of Yb	6
2.1.1 Zeeman slower	7
2.1.2 Intercombination magneto-optical trap	7
2.1.3 FORT and evaporative cooling	8
2.2 Quantum degenerate gases and mixtures with Yb	10
2.2.1 The first BEC in two-electron atoms: ^{174}Yb	10
2.2.2 BEC in other isotopes: ^{168}Yb and ^{170}Yb	11
2.2.3 Degenerate fermi gases: ^{171}Yb and ^{173}Yb	12
2.2.4 Fermi–Fermi mixture of ^{171}Yb and ^{173}Yb	13
2.2.5 Optical Stern–Gerlach effect	14
2.2.6 Bose–Fermi mixtures of Yb	16
2.2.7 Bose–Bose mixtures of Yb	18
2.3 Mixtures of Alkali-earth-metal-like atoms and Alkali-atoms	19
3 Quantum Many-body Physics of Yb Atoms in an Optical Lattice	20
3.1 Superfluid (SF)-Mott insulator (MI) transition	20

3.2	Dual Mott insulators of bosons and fermions	25
3.2.1	The system of dual Mott insulator	25
3.2.2	Repulsively interacting dual Mott insulator	27
3.2.3	Attractively interacting dual Mott insulator	28
3.2.4	Thermodynamics	28
3.3	A Fermi-Fermi mixture in an optical lattice	29
4	Photoassociation of Ultracold Ytterbium Atoms	30
4.1	1S_0 - 1P_1 photoassociation spectroscopy	30
4.2	1S_0 - 3P_1 photoassociation spectroscopy	34
4.3	Special case: Dicke's subradiant state	37
4.4	Two-color photoassociation spectroscopy	39
4.5	Optical Feshbach resonance	42
5	Summary	46
	Acknowledgments	47
	References	47
2.	Rotational Excitations of Polar Molecules on an Optical Lattice: From Novel Exciton Physics to Quantum Simulation of New Lattice Models	53
	<i>Marina Litinskaya and Roman V. Krems</i>	
1	Introduction	53
2	Quantum Simulation of Lattice Models	55
2.1	Lattice models	56
2.2	Bosons, Fermions and Paulions	58
3	Rotational Frenkel Excitons	60
4	Binary Interactions between Frenkel Excitons	65
4.1	Dynamical and kinematic interactions	65
4.2	External field control of exciton–exciton interactions	66
4.3	Suppression of kinematic interaction	68
5	Rotational Excitons in a Tunable Disordered Potential	71
5.1	Optical lattice with tunable disorder	72
5.2	Resonant enhancement of exciton–impurity scattering	73

5.3	Disorder correlations and localization–delocalization crossover	77
6	Quantum Simulation of Holstein Polaron Model	78
7	Conclusions	81
	Acknowledgments	82
	References	82
3.	Quantum Phase Transition of Cold Atoms in Optical Lattices	87
	<i>Yaohua Chen, Wei Wu, Guocai Liu and Wuming Liu</i>	
1	Introduction	87
2	Optical Lattices	89
2.1	2D square optical lattice	89
2.2	Triangular optical lattice	90
2.3	Honeycomb optical lattice	92
2.4	Kagomé optical lattice	92
2.5	Theoretical model	94
2.6	Simulation of the spin-orbital coupling by laser-induce-gauge-field method	95
3	Dynamical Mean-Field Theory	96
3.1	Introduction	96
3.2	Dynamical cluster approximation	96
3.3	Cellular dynamical mean-field theory	98
4	Quantum Phase Transition of Cold Atoms	99
4.1	Introduction	99
4.2	Quantum phase transition of cold atoms in triangular lattices	104
4.3	Quantum phase transition of cold atoms in honeycomb lattices	107
4.4	Quantum phase transition of cold atoms in triangular Kagomé lattice	111
5	Quantum Phase Transition of Cold Atoms with Spin-Orbital Coupling	117
5.1	Quantum phase transition of cold atoms in honeycomb lattices with spin-orbital coupling	117
5.2	Quantum phase transition of cold atoms in Kagomé lattices with spin-orbital coupling	120

6	Experimental Protocol	122
6.1	The detection of Mott insulator in optical lattice . . .	122
6.2	The detection of quantum spin Hall state in optical lattice	123
7	Conclusion and Perspectives	124
	Acknowledgments	124
	References	124
Part II. Physics with Bose–Einstein Condensates		129
4.	Unlocking the Mysteries of Three-Dimensional Bose Gases Near Resonance	131
	<i>Mohammad S. Mashayekhi, Jean-Sébastien Bernier and Fei Zhou</i>	
1	Introduction	131
2	Current Experimental Status	133
2.1	Dilute limit	133
2.2	Strongly interacting regime: beyond the dilute limit . .	134
3	Current Theoretical Understanding	135
3.1	Dilute limit	135
3.2	Strongly interacting regime: beyond the dilute limit . .	135
3.2.1	Results and comparison to other theories	136
3.2.2	Comparison to experiments	140
4	Open Experimental and Theoretical Questions	140
	Acknowledgments	141
	References	142
5.	Light Induced Gauge Fields for Ultracold Neutral Atoms	145
	<i>I. B. Spielman</i>	
1	Introduction	145
2	Statement of Problem	148
3	Artificial Electric and Magnetic Fields	151
3.1	Toy model: rotation	152
4	Alkali Atoms	156
4.1	Two laser frequencies	158
4.1.1	Two Raman beams	159

4.2	Dressed states: adiabatic picture	161
4.3	Dressed states: explicit picture	163
4.3.1	Two-level system	164
4.3.2	Synthetic fields	168
4.3.3	Limitations	170
4.3.4	Three-level system	170
4.3.5	Interpretation: canonical and mechanical variables	172
4.4	Experimental implementation	173
4.4.1	Introduction of a vector potential	174
4.4.2	Induction of an electric field	175
4.4.3	Inclusion of a magnetic field	177
5	Engineered Spin-Orbit Coupling	179
5.1	General idea	179
5.2	Experimental implementation of SOC	182
6	Conclusion	184
	Acknowledgments	184
	References	185
6.	Manipulation of a Bose-Einstein condensate	189
	<i>Xiaoji Zhou, Xuzong Chen and Yiqiu Wang</i>	
1	Introduction	189
2	Manipulation of BEC's Internal State by Majorana Transition	191
3	Manipulation of BEC's External State by Superradiance	196
3.1	Superradiant scattering at variable incidence angle	197
3.1.1	Experimental description	197
3.1.2	Patterns at $\theta = 90^\circ$	199
3.1.3	Line patterns at $\theta = 0^\circ$	200
3.1.4	Patterns at other angles	202
3.1.5	Theory	204
3.2	Superradiant scattering at several pumping frequencies	206
3.2.1	Two-frequency-pumping superradiance	207
3.2.2	Imprinting light phase on matter wave gratings	212

3.2.3	Momentum transfer in the high order modes	216
3.3	Effects of the effective linewidth of pump laser on co-operative atomic scattering	217
4	Manipulation of BEC's External State by Standing Wave Pulses	220
4.1	Theoretical description of atoms diffraction from standing wave pulse laser	221
4.2	Experimental demonstration of multi-pulse scattering	223
4.2.1	One-pulse scattering	225
4.2.2	Two-pulse scattering	227
4.2.3	Three- and four-pulse scattering	229
4.3	Design atomic interferometry momentum states with standing wave pulses	230
4.4	Rapid nonadiabatic loading in an optical lattice with standing pulsed perturbations	232
5	Manipulation of BEC's External State in Optical Lattice	237
5.1	Theoretical description of scattering from an array of condensates	238
5.2	Experimental setup	240
5.3	Competition between different modes	242
5.4	Cooperative scattering measurement of coherence	246
5.5	Excitation in the lattice	249
6	Summary	253
	References	254
7.	Experimental Methods for Generating Two-Dimensional Quantum Turbulence in Bose–Einstein Condensates	261
	<i>K. E. Wilson, E. C. Samson, Z. L. Newman, T. W. Neely and B. P. Anderson</i>	
1	Introduction	262
1.1	Experimental study of two-dimensional quantum turbulence in BECs	263
2	Overview of Two-Dimensional Turbulence	265
2.1	Key ideas of 2D turbulence	265
2.2	Vortices and 2D quantum turbulence in BECs	267

- 3 Experimental Setup 270
- 4 Nucleation of Vortex Dipoles and Vortex Clusters 273
 - 4.1 Overview of experiment 274
 - 4.2 Implications for the experimental study of 2DQT 276
- 5 Generating Turbulent States by Modulating the Magnetic Trapping Potential 277
 - 5.1 Symmetric modulation: harmonic trap 278
 - 5.2 Symmetric modulation: annular trap 280
 - 5.3 Rotation of an elliptical magnetic trapping potential 281
- 6 Generating Turbulent States with a Stationary Blue-Detuned Laser 286
 - 6.1 Short pulse of blue-detuned laser light 286
 - 6.2 Intensity modulation of a blue-detuned laser beam 288
- 7 Stirring with a Blue-Detuned Laser Beam 292
- 8 Conclusions 295
- Acknowledgments 296
- References 296

Part III. Atom–Light Interactions 299

- 8. Nonlinear Optics Using Cold Rydberg Atoms 301
 - Jonathan D. Pritchard, Kevin J. Weatherill and Charles S. Adams*
 - 1 Introduction 301
 - 1.1 Optical Kerr nonlinearities 302
 - 1.2 Electromagnetically induced transparency 306
 - 1.3 Cooperative phenomena 307
 - 2 Rydberg EIT 310
 - 2.1 Dipole blockade 310
 - 2.2 Rydberg EIT 312
 - 3 Electromagnetically Induced Transparency in Cold Rydberg Gases 314
 - 3.1 Coherent optical detection of Rydberg states 315
 - 3.2 Sensitivity to electric fields 317
 - 3.2.1 Giant electro-optic effect 317
 - 3.2.2 Electrometry 318
 - 3.3 Interaction effects 320

3.3.1	Superradiant cascade	320
3.3.2	Co-operative optical nonlinearity	321
3.4	Attractive interactions	324
3.5	Resonant dipole–dipole interactions	326
3.6	Detection of impurities	328
4	Rydberg Quantum Optics	328
4.1	Photon sources	329
4.1.1	Deterministic photon source	329
4.1.2	Atom-light interfaces	332
4.1.3	Probabilistic photon sources	332
4.2	From Rydberg blockade to photon blockade	335
4.3	Quantum gates	338
4.4	Detection	340
4.5	Experimental progress	342
4.6	Hybrid quantum optical interfaces	343
5	Outlook	345
	Afterword	346
	References	346
9.	Mirror-Mediated Cooling: A Paradigm for Particle Cooling via the Retarded Dipole Force	351
	<i>Tim Freegarde, James Bateman, André Xuereb and Peter Horak</i>	
1	Introduction	352
2	Memory in Optical Cooling	352
2.1	Doppler cooling	353
2.2	Sisyphus cooling	354
2.3	Cavity-mediated cooling	355
3	Mirror-Mediated Cooling	356
3.1	Classical description	356
3.2	Semi-classical description	359
4	Binding and Higher-Order Cooling Terms	362
5	Transfer Matrices	365
6	Enhancements and Optomechanics	369
6.1	External cavity cooling	369
6.2	Amplified feedback cooling	371
7	Conclusion	372

Acknowledgments	373
References	374
10. Cavity Quantum Optics with Bose–Einstein Condensates	377
<i>Lu Zhou, Keye Zhang, Guangjiong Dong</i>	
<i>and Weiping Zhang</i>	
1 Introduction	377
2 Cavity-Mediated Atomic Dynamics: Centre-of-Mass Motion	379
2.1 Cavity-optomechanics with BEC	379
2.2 Simulation of Dicke quantum phase transition	385
2.3 Cavity-induced switching between atomic localized and extended states	389
3 Cavity-Mediated Atomic Dynamics: Spin Dynamics	396
4 Cavity-Assistant Quantum Measurement of Ultracold Atomic Gases	399
4.1 Identifying quantum phases of atomic gases with optical cavity	401
4.2 Measurement backaction on the quantum spin-mixing dynamics	403
5 Summary and Outlook	410
Acknowledgments	411
References	412
 Part IV. Fundamental Physics	 415
11. Cold Atoms and Maxwell’s Demon	417
<i>Daniel A. Steck</i>	
1 Introduction	417
2 Level Schemes for Asymmetric Barriers	419
3 Maxwell’s Demon	426
4 Asymmetric-Barrier Dynamics	429
4.1 Complications and solutions	434
5 Cooling Atoms	438
6 Prospects for Molecular Cooling	440
References	441

12. Thermalization from the Perspective of Eigenstate Thermalization Hypothesis	443
<i>V. Dunjko and M. Olshanii</i>	
1 Introduction	443
2 The “Generic” Thermalization	445
3 The Eigenstate Thermalization Hypothesis	448
3.1 Eigenstate thermalization property	448
3.2 Narrowness in energy	449
3.3 Smallness of the off-diagonals	451
3.4 Eigenstate thermalization scenario	452
3.5 Eigenstate thermalization hypothesis (ETH) (preliminary definition)	452
3.6 Quantum versus temporal versus eigenstate-to- eigenstate fluctuations	453
3.7 An attempt at a careful definition of the eigenstate thermalization property	454
4 Equilibration Versus Thermalization	457
5 Equilibration and the Absence of Thermalization in Integrable Systems	457
6 Thermalization and the ETH in Nonintegrable Systems . .	460
6.1 Which systems thermalize?	460
6.2 Prethermalization	462
6.3 Thermalization and quantum chaos	462
6.4 Thermalization and many-body localization	464
7 Outlook	466
Acknowledgments	467
References	467
13. Cold Atoms and Precision Measurements	473
<i>Wencui Peng, Biao Tang, Wei Yang, Lin Zhou, Jin Wang and Mingsheng Zhan</i>	
1 General Introduction	473
2 Progress of Cold Atoms Preparation	474
2.1 Magneto-optical trap	475
2.2 Single atom trap	476

2.3	Ion trap	477
3	Progress of Atom Interferometry	477
4	Gravity Measurement Using Atom Interferometry	481
4.1	Gravity measurement	481
4.2	Gravity gradient measurement	483
5	Rotation Measurement Using Atom Interferometry	483
6	Gravitational Wave Detection	487
6.1	Gravitational wave	487
6.2	Situation and progress	488
6.3	Gravitational wave detection using atom interferometer	489
7	Cold Atom Clock	490
7.1	Microwave clock	490
7.2	Space clock	494
7.3	Optical clock	495
7.4	Chip based clock	498
8	Determination of the Fundamental Constant	499
8.1	Determination of gravitational constant	499
8.1.1	Traditional methods of gravitational constant measurement	499
8.1.2	Determination of gravitational constant with cold atoms	499
8.2	Determination of fine structure constant	501
8.2.1	Traditional methods of fine structure constant determination	501
8.2.2	Determination fine structure constant with cold atoms	502
9	Testing Fundamental Physics	503
9.1	Equivalence principle test	504
9.2	Local Lorentz invariance test	506
9.3	Test of local position invariance	506
9.4	Other tests	507
10	Summary	507
	References	508
