<i>General Preface</i>	v
<i>Preface to Volume 3</i>	vii
<i>Contents of Volume 3</i>	xi
<i>Contributors to Volume 3</i>	xiii
<i>Interviewing Nobel Prize Winner Gerhard Ertl</i>	xv
1. J.W. Gadzuk <i>Fundamental Atomic-Scale Issues/Processes Pertinent to Dynamics at Surfaces</i>	1
2. A.W. Kleyn <i>Basic Mechanisms in Atom–Surface Interactions</i>	29
3. J.R. Manson <i>Energy Transfer to Phonons in Atom and Molecule Collisions with Surfaces</i>	53
4. M. Persson and S. Andersson <i>Physisorption Dynamics at Metal Surfaces</i>	95
5. G.R. Darling <i>Intra-molecular Energy Flow in Gas–Surface Collisions</i>	141
6. G.O. Sitz <i>Inelastic Scattering of Heavy Molecules from Surfaces</i>	197
7. V.P. Zhdanov <i>Reaction Dynamics and Kinetics: TST, Non-equilibrium and Non-adiabatic Effects, Lateral Interactions, etc.</i>	231
8. T. Bligaard, J.K. Nørskov and B.I. Lundqvist <i>Understanding Heterogeneous Catalysis from the Fundamentals</i>	269
9. R. Imbihl <i>Non-linear Dynamics in Catalytic Reactions</i>	341
10. B.I. Lundqvist, A. Hellman and I. Zorić <i>Electron Transfer and Nonadiabaticity</i>	429
11. R. Berndt and J. Kröger <i>Dynamics of Electronic States at Metal Surfaces</i>	525

12. N. Lorente	
<i>Theory of Tunneling Currents and Induced Dynamics at Surfaces</i>	575
13. E. Hasselbrink	
<i>Photon Driven Chemistry at Surfaces</i>	621
14. A.J. Mayne and G. Dujardin	
<i>STM Manipulation and Dynamics</i>	681
15. H. Brune	
<i>Creating Metal Nanostructures at Metal Surfaces Using Growth Kinetics</i>	761
16. K.W. Kolasinski	
<i>Growth and Etching of Semiconductors</i>	787
17. H.M. Urbassek	
<i>Sputtering and Laser Ablation</i>	871
<i>Author index</i>	915
<i>Subject index</i>	991

Contents

1.1. Introduction	3
1.2. General quantum dynamics for surfaces	4
1.3. Trajectoryizing	8
1.4. Diabatic transitions	10
1.5. Anderson orthogonality, Friedel, phase shifts and friction	13
1.6. Electron-resonance-enhanced dynamics	19
1.7. Final thoughts	24
References	25

Contents

2.1. Introduction	31
2.2. Need for simple models	31
2.3. Interaction potentials	31
2.4. Limiting cases in the scattering dynamics	34
2.4.1. Full molecular dynamics	34
2.4.2. Hard cube model	35
2.4.3. Hard sphere scattering	36
2.4.4. Rainbow scattering	38
2.4.5. Washboard model	41
2.4.6. Different surface regions	44
2.5. Limiting cases in adsorption dynamics	45
2.5.1. Cube models	45
2.5.2. Displacement trapping and implantation	49
2.6. Conclusion	50
References	51

Contents

3.1. Introduction	55
3.2. Basic model for multiphonon excitation	56
3.3. Experimentally measured quantities	60
3.4. Surface scattering theory	62
3.4.1. General treatment	62
3.4.2. Atom-surface scattering	63
3.4.3. Rigid molecular rotator	66
3.4.4. Molecular internal vibration modes	67
3.4.5. Interaction potential	70
3.5. Comparisons with experiment	72
3.5.1. Angular distributions	72
3.5.2. Translational energy resolved spectra	77
3.5.3. Rotational energy resolved spectra	82
3.5.4. Internal vibrational mode excitation	87
3.6. Conclusions	88
Acknowledgement	90
References	90

Contents

4.1. Introduction	97
4.2. The physisorption interaction	98
4.2.1. van der Waals attraction and Pauli repulsion	99
4.2.2. Selective adsorption and bound levels	101
4.2.3. Molecular anisotropy	102
4.3. Sticking, trapping and energy transfer	104
4.3.1. Single- and multi-phonon regime: Forced Oscillator Model	107
4.3.2. One-phonon regime: Distorted wave Born approximation	113
4.3.3. Mean free paths of quasi-bound states	117
4.3.4. Sticking of positive-energy trapped particles	120
4.3.5. Resonant sticking	123
4.4. Thermal desorption	124
4.5. Photodesorption of physisorbed species	127
4.5.1. Dipole transitions in the physisorption well	128
4.5.2. Direct infrared photodesorption of physisorbed H ₂	130
4.5.3. Indirect infrared photodesorption of H ₂	135
4.5.4. Photodesorption of He	135
4.6. Concluding remarks	136
Acknowledgements	137
References	137

Contents

5.1. Introduction	145
5.2. Probing the potential energy surface	147
5.2.1. Is the motion adiabatic?	147
5.2.2. Basic interactions in the PES	150
5.3. Quantum or classical descriptions of the dynamics	150
5.4. Changing direction – diffraction, physisorption and steering	153
5.5. Rotational excitation	159
5.5.1. Excitation of rotations and parallel translations	163
5.6. Changing the vibrational state of the molecule	165
5.6.1. Surface site and rotational state dependence of vibrational excitation/de-excitation	167
5.7. Dissociation	171
5.7.1. Direct, trapping or steering	172
5.7.2. Incidence angle dependence of dissociation	173
5.7.3. Molecular rotation and dissociation	175
5.7.4. Molecular vibrations	178
5.7.5. Classical mechanics versus quantum mechanics in dissociation	182
5.8. Substrate excitations and intra-molecular energy flow	183
5.8.1. Molecule–phonon coupling	185
5.8.2. Electron–hole pair interactions	188
5.9. Conclusions	191
Acknowledgements	192
References	192

Contents

6.1. Introduction	199
6.2. Experimental techniques	202
6.2.1. Molecular beams	203
6.2.2. Quantum state specific detection	203
6.3. Diatomic molecules	204
6.3.1. Translation	204
6.3.2. Rotation	205
6.3.2.1. Nitric oxide	207
6.3.2.2. Nitrogen and carbon monoxide	210
6.3.2.3. Angular momentum polarization	215
6.3.3. Vibration	219
6.3.3.1. Vibrational survival and relaxation	220
6.3.3.2. Vibrational excitation	220
6.3.3.3. Highly excited vibrations	222
6.4. Polyatomics	222
6.4.1. Rotation	223
6.4.2. Vibration	224
6.5. Conclusion and outlook	226
Acknowledgements	226
References	226

Contents

7.1. Introduction	233
7.2. Transition-state theory	234
7.3. Tunneling	237
7.4. Non-equilibrium effects	237
7.5. Non-adiabatic effects	240
7.6. Lateral interactions	245
7.6.1. General equations	247
7.6.2. Temperature-programmed desorption	249
7.6.3. Surface diffusion	254
7.6.4. Conventional reaction kinetics	256
7.6.5. Oscillations, chaos and pattern formation	259
7.7. Surface heterogeneity	261
7.8. Reaction kinetics on nm-sized catalyst particles	262
7.9. Conclusion	263
Acknowledgements	264
References	264

Contents

8.1. Introduction	273
8.2. Surface-science heritage of understanding	277
8.2.1. Introduction	277
8.2.2. Descriptors for metal catalysts	277
8.2.3. Trends in adsorption energies on transition metal surfaces	279
8.2.4. The d-band model	280
8.2.4.1. One-electron energies and binding-energy trends	281
8.2.4.2. The Newns–Anderson model	284
8.2.5. Trends in chemisorption energies	286
8.2.5.1. Variations in adsorption energies from one metal to the next	286
8.2.5.2. Ligand effects in adsorption – changing the d-band center	288
8.2.5.3. Ensemble effects in adsorption – the interpolation principle	293
8.2.6. Trends in activation energies for surface reactions	295
8.2.6.1. Electronic effects in surface reactivity	295
8.2.6.2. Geometric effects in surface reactivity	297
8.2.7. Brønsted–Evans–Polanyi relationships in heterogeneous catalysis	298
8.2.7.1. Correlations from DFT calculations	299
8.2.7.2. Universal relationships	302
8.2.8. Activation barriers and rates	304
8.2.8.1. Transition-state theory	305
8.2.8.2. Variational transition state theory and recrossings	306
8.2.8.3. Harmonic transition state theory (HTST)	306
8.3. Variations in catalytic rates – volcano relations	308
8.3.1. Dissociation rate-determined model	310
8.3.2. Sabatier analysis	311
8.4. Optimization and design of catalysts through modeling	313
8.4.1. The low-temperature water gas shift (WGS) reaction	314
8.4.2. Methanation	315
8.5. Some catalytic reactions from the fundamentals	318
8.5.1. Introduction	318
8.5.2. Kinetic simulations of oxidation of some monoxides	318
8.5.2.1. $\text{NO} + \text{O} \rightarrow \text{NO}_2$	319
8.5.2.2. $\text{CO} + \text{O} \rightarrow \text{CO}_2$	324
8.5.3. Ammonia synthesis	325
8.5.4. Hydrogen evolution reaction on MoS_2 and close interplay between theory and experiment	330
8.6. Conclusions and outlook	333
References	335

Contents

9.1. Introduction	345
9.2. Observation of rate oscillations	346
9.3. Theoretical background	349
9.3.1. Basic definitions	349
9.3.2. Bifurcations	351
9.3.3. Activator-inhibitor models	352
9.3.3.1. Point models	352
9.3.3.2. Simple wave patterns	353
9.3.4. Mathematical modeling of surface reactions	355
9.4. Oscillation mechanisms	356
9.4.1. Catalytic CO oxidation on Pt	356
9.4.1.1. Bistability	356
9.4.1.2. The surface phase transition model	357
9.4.1.3. Mathematical modeling of the SPT mechanism	361
9.4.1.4. Facetting and oscillations on high-index planes	362
9.4.1.5. The oxide model and the pressure gap	366
9.4.2. Catalytic CO oxidation on Pd surfaces	368
9.4.3. Catalytic NO reduction	370
9.4.3.1. NO reduction on Pt and Rh surfaces	370
9.4.3.2. Pt(100)/NO + CO	371
9.4.3.3. The NO + H ₂ and NO + NH ₃ reaction on Pt(100)	373
9.4.3.4. The NO + H ₂ reaction on Rh surfaces	374
9.4.3.5. NO reduction on Ir surfaces	377
9.5. Chemical wave patterns	377
9.5.1. Basic considerations	377
9.5.1.1. Differences to patterns in the liquid phase	377
9.5.1.2. Spatially resolving <i>in situ</i> methods	378
9.5.1.3. Survey of experimentally studied systems	381
9.5.1.4. Mathematical modeling	381
9.5.2. Simple chemical wave patterns	383
9.5.2.1. Bistability and front nucleation	383
9.5.2.2. Target patterns, spiral waves	384
9.5.3. Patterns modified by surfaces	386
9.5.3.1. Global coupling	386
9.5.3.2. State-dependent anisotropy	388
9.5.4. Complex patterns due to structural or chemical modifications of the substrate	390
9.5.4.1. Subsurface oxygen formation	390
9.5.4.2. Reaction-induced substrate changes	396
9.5.5. Patterns driven by energetic interactions	396
9.5.5.1. General remarks	396
9.5.5.2. Reactive phase separation	398
9.5.5.3. Mass transport with pulses	399

9.5.6. Atomic scale experiments and fluctuations	401
9.5.6.1. Scanning tunneling microscopy	401
9.5.6.2. Field electron and field ion microscopy	402
9.5.6.3. Fluctuations in surface reactions	404
9.6. Chaos and turbulence	409
9.6.1. Temporal chaos	409
9.6.2. Turbulence	410
9.7. Controlling wave patterns and oscillations	411
9.7.1. Parameter forcing	411
9.7.2. Controlling turbulence	413
9.7.3. Microstructured surfaces	413
9.7.3.1. Basic concepts	413
9.7.3.2. Unreactive boundaries	415
9.7.3.3. Reactive boundaries	417
9.7.4. Manipulation by local laser heating	419
9.8. Conclusions and outlook	419
Acknowledgements	420

Contents

10.1. Introduction	433
10.2. Adiabaticity and nonadiabaticity	435
10.2.1. Mathematical preliminaries	436
10.2.2. Adiabatic approximation	437
10.2.3. Curve crossing	438
10.2.4. One-state problem	438
10.2.5. Two-state problem	439
10.2.6. Nonadiabatic transitions between two states	440
10.2.7. Nonadiabatic transitions between multiple states – semiclassically	441
10.2.8. Nonadiabatic transitions between multiple states – a quantum case	446
10.2.9. Master equation for ET processes	447
10.2.10. In summary	448
10.2.11. Time-dependent density-functional theory and nonadiabaticity	448
10.2.12. Friction treatment	448
10.3. Electron transfer	449
10.3.1. Introduction	449
10.3.2. Image potential	452
10.3.3. Adsorbate-induced electron structure	453
10.3.4. Molecule–surface collisions	454
10.3.5. Nonadiabaticity	455
10.3.6. Dynamic electron transfer	455
10.3.6.1. Multitude of electron-transfer processes	456
10.3.7. Summary	471
10.4. Nonadiabatic processes at surfaces	471
10.4.1. Electron and ion spectroscopy according to Hagstrum	471
10.4.2. Surface chemiluminescence and the NNL model	475
10.4.3. Vibrational damping of adsorbates	483
10.4.4. Exoelectrons and chemicurrents	487
10.4.5. Abstraction	493
10.4.6. Summary	495
10.5. Chemical reactions at surfaces	496
10.5.1. Sticking	497
10.5.2. Vibrational dynamics	510
10.5.3. Thermal chemical reactions at surfaces	513
10.6. Conclusions and outlook	514

16.8. Case studies	828
16.8.1. Silicon epitaxy: Silane/Si	828
16.8.2. Compound semiconductor epitaxy: III–V growth	837
16.8.3. Silicon dry etching: F/Si etching	842
16.8.4. Silicon wet etching: HF/Si	845
16.8.5. Silicon wet etching: KOH/Si	849
16.9. Future perspectives	851
Acknowledgements	852

Contents

17.1. Introduction	875
17.2. Sputtering by ion bombardment	875
17.2.1. Stopping	875
17.2.1.1. Potentials	875
17.2.1.2. Cross sections	878
17.2.1.3. Stopping power	879
17.2.1.4. Electronic stopping	880
17.2.2. Implantation of the ion and damage in the target	881
17.2.2.1. Ranges	881
17.2.2.2. Recoil generation: The linear cascade	882
17.2.2.3. Deposited energy	883
17.2.2.4. Recoil spectrum and damage	883
17.2.3. Sputtering	885
17.2.3.1. Sputter yields	885
17.2.3.2. Threshold sputtering	886
17.2.3.3. Surface binding energy	886
17.2.3.4. Sputtered atom energy distribution	887
17.2.3.5. Angular distribution	888
17.2.3.6. Depth of origin	889
17.2.3.7. Fluctuations in sputtering	889
17.2.3.8. Surface topography changes	890
17.2.3.9. Cluster emission	890
17.3. High energy densities: Sputtering from spikes	891
17.3.1. Models	893
17.3.2. Cluster impact	895
17.3.3. Crater formation	896
17.3.4. Linear vs nonlinear sputtering	896
17.4. Ablation of metals by ultrafast laser pulses	898
17.4.1. From energy absorption to the two-temperature model	898
17.4.1.1. Light absorption	898
17.4.1.2. Two-temperature model	899
17.4.1.3. Electronic heat conduction	900
17.4.1.4. Example: Instantaneous homogeneous excitation	900
17.4.2. Materials effects	901
17.4.2.1. Overview	901
17.4.2.2. Thermomechanical spallation	904
17.4.2.3. Pressure wave	905
17.4.2.4. Ablation yield and threshold	906
17.4.3. Further effects: Longer laser pulses and post-emission effects	907
17.5. Outlook	909
