

Contents

1. Introduction	1
2. Hidden sector of particle physics	15
1. Theory of elementary particles – the standard model	15
1.1. Quantum electrodynamics	18
1.2. Gauge symmetry of quantum electrodynamics	23
1.3. Symmetry of the fundamental particles	25
1.4. Standard model of electroweak and strong interactions	29
2. Aesthetic and practical reasons for the extension of the standard model	35
2.1. New physics of Grand Unification	36
2.2. New physics in modern models of Grand Unification	38
2.3. Restrictions on baryon and lepton photons	43
3. Neutrino mass and the invisible axion	45
3.1. Physics of the neutrino mass	45
3.2. Instability of the neutrino	50
3.3. Axion solution to the problem of strong CP-violation in QCD	56
3.4. Models of the invisible axion	61
3. Hidden parameters of modern cosmology	69
1. Old scenario of Big Bang Universe	69
1.1. Expanding Universe	69
1.2. Thermal electromagnetic background – trace of hot Universe	75
1.3. Physical cosmology of the old Big Bang scenario	80
2. Inflationary cosmology with baryosynthesis and dark matter/energy	96
2.1. Magnetic monopoles in the old Big Bang model	97
2.2. Inflationary recovery of the old Big Bang model	108
2.3. Baryosynthesis	116
2.4. Non-baryonic dark matter and dark energy	120
4. Cosmoarcheology of early Universe	124
1. Primordial black holes as a tool for cosmoarcheology	125
1.1. Primordial black holes	125

1.2.	Primordial black holes as a manifestation of dust stages in the early Universe	128
1.3.	Direct formation of PBH in dust stages	131
1.3.	Evaporation of PBHs	136
2.	The formation of black holes in the first order phase transitions	138
2.1.	Configuration of the field in the collision of bubble walls	139
2.2.	Gravitational collapse of the false vacuum bag and the formation of PBH	141
2.3.	First order phase transitions in the early Universe	146
5.	Relic particles in the period of Big Bang nucleosynthesis	153
1.	Effects of new particles and nucleosynthesis	153
1.1.	Constraints on the total cosmological density	159
1.2.	Shift of the equilibrium rate of β -processes	166
1.3.	Non-equilibrium particles and abundance of ^4He	172
2.	Metastable particles and the spectrum of thermal background radiation	177
2.1.	Distortion of the spectrum of thermal electromagnetic background	177
2.2.	Dominance of metastable particles during nucleosynthesis	183
6.	Antiprotons in the Universe after Big Bang nucleosynthesis	191
1.	PBH evaporation as the source of the nucleon–antinucleon pairs	192
2.	Effects of the annihilation of antiprotons with ^4He nuclei in the abundance of deuterium and ^3He	202
3.	Constraints on sources of antiprotons	207
3.1.	Constraints on primordial black holes and the theoretical mechanism of their formation	207
3.2.	Problem of relic gravitinos	213
3.3.	Constraints on the structure of domains of antimatter	218
7.	Non-equilibrium effects as a test of new physics	220
1.	Non-equilibrium cosmological nucleosynthesis	220
1.1.	Kinetic equation for non-equilibrium particles	221
1.2.	Kinetic equation for weak sources in the RD stage	225
1.3.	Non-equilibrium nucleosynthesis. Some special cases	230
2.	ASTROBELIX project	237
2.2.	Constraints on antiprotons annihilating in the RD stage, from the observed abundance of lithium and beryllium	242
3.	Cosmological backgrounds of non-equilibrium particles	244

3.1.	High-energy neutrinos on the RD stage	244
3.3.	Large volume experiments as a tool for cosmoparticle physics	253
8.	New physics in formation of the large-scale structure	257
1.	The problems of large-scale structure	257
1.1.	The problem of initial fluctuations	257
1.2.	The problem of self-consistent formation of structure of inhomogeneities and anisotropy of cosmic microwave background radiation	260
1.3.	Problem of physical consistency in the theory of large-scale structure formation	264
2.	Neutrino mass and large scale structure of Universe	266
2.1.	Massive neutrinos in the Universe	267
2.2.	Gravitational instability of gas of massive neutrinos	272
2.3.	Formation of structure in the neutrino-dominated Universe	281
9.	Physical nature of dark matter of the Universe	286
1.	The structure of the Universe as a particle detector of dark matter	286
1.1.	Constraints on unstable particles from the conditions of formation of the structure	286
1.2.	Difficulties of simple models of dark matter	296
1.3.	Arguments in favour of unstable dark matter component	303
2.	Dark matter in the galaxy	309
2.1.	Condensation of dark matter in galaxies	309
2.2.	Annihilation of weakly interacting massive particles in the Galaxy	312
2.3.	Search for WIMP in the Galaxy on the basis of their direct and indirect effects	315
10.	Mirror world in the Universe	327
1.	Mirror particles	327
1.1.	Equivalence of left and right in the nature	327
1.2.	Fractons and Alice strings	330
2.	Mirror particles in early Universe	335
2.1.	Inflation and the constraints on the mirror domain structure	335
2.2.	Inhomogeneous baryosynthesis and island distribution of mirror baryons	337
2.3.	Nucleosynthesis and the mirror world	338
3.	The formation of astronomical objects from mirror matter	339
3.1.	Separation of ordinary and mirror matter	342
3.2.	Accretion of gas on astronomical objects with different mirrority	350

4.	Observational physics of mirror matter	356
4.1.	Galaxies and clusters of galaxies with specific mirrority	357
4.2.	Mirror matter on the scale of globular clusters.....	361
4.3.	Effects of mirror matter at the scale of stars.....	364
11.	Cosmoparticle physics of horizontal unification	370
1.	Physical grounds of horizontal unification	370
1.1.	Symmetry of generations of fermions	370
1.2.	Gauge model of broken symmetry between the generations.....	374
2.	Early Universe in the model of horizontally unification	380
2.1.	Inflation dynamics and the energy scale	380
2.2.	Formation of primordial black holes in a model of horizontal unification...	382
2.3.	Early ‘horizontal’ phase transitions	385
2.4.	Large-scale modulation in the distribution of the primordial axion field	388
3.	Model of horizontal unification and cosmology of dark matter	394
3.1.	Unified description of various forms of dark matter on the basis of the hidden sector of models of horizontal unification	394
3.2.	Models of dark matter resulting in horizontal unification	397
3.3.	History of the Universe based on the model of horizontal unification	405
