Part 1: Potential Scattering	1
1. Basic Notions	3
1.1 Introduction	3
1.2 Several definitions	5
1.2.1 Types of collisions — reaction channels	6
1.2.2 Q -values, threshold, open and closed channels	7
1.3 Cross sections	8
1.3.1 Center of mass and laboratory frames	9
1.4 Classical scattering	14
1.4.1 The classical cross section	16
1.4.2 Orbiting, rainbow and glory scattering	18
1.5 Stationary scattering of a plane wave	22
1.6 Scattering of a wave packet	25
1.6.1 Propagation of a free wave packet	25
1.6.2 Collision of the wave packet with a target	29
1.6.3 The Optical Theorem	33
1.7 Systems of units	36
1.7.1 Nuclear physics	36
1.7.2 Atomic and molecular physics	38

2. The Partial Wave Expansion Method	41	4.3 The time-dependent picture	122
2.1 Free particle in spherical coordinates	44	4.3.1 Time-dependent definition of the scattering operator	125
2.2 Numerical solutions of the radial equation	47	4.3.2 Energy conservation	127
2.3 Scattering amplitude and cross section	50	4.3.3 Time-reversal	128
2.4 Wronskian relations	55	4.4 Scattering from non-local separable potentials	130
2.5 Integral formulae for the phase shifts	56	4.5 Scattering from the sum of two potentials	133
2.6 Convergence of the partial-wave expansion	57	4.5.1 The Gell-Mann Goldberger relations	134
2.7 Hard sphere scattering	58	4.5.2 The Distorted Wave series	135
2.8 Absolute phase shifts — Levinson Theorem	59	4.6 Partial-wave expansions	136
2.9 Resonances	63	4.6.1 Partial-wave projection of the S- and the T-matrices	139
2.9.1 Time delay	65	4.6.2 The partial-wave projected two-potential formula	142
2.10 Scattering from a square-well	68	4.7 Long range potentials	142
2.11 Low energy scattering	70	4.8 Evaluation of partial-wave Green's functions	146
2.11.1 The scattering length	70	4.8.1 Free particle's Green's function	147
2.11.2 The effective range formula	73	4.8.2 Green's functions for an arbitrary potential	150
3. Coulomb Scattering	79	5. Approximate Methods in Potential Scattering	157
3.1 Classical mechanics description of Coulomb scattering	79	5.1 Perturbative approximations	157
3.2 Quantum mechanical description	81	5.1.1 The Born series	157
3.2.1 The quantum mechanical cross section in Coulomb scattering	84	5.1.2 The Distorted Wave Born series	166
3.3 Partial wave expansion	86	5.2 Semiclassical approximations	177
3.3.1 Approximate Coulomb phase shifts — asymptotic series	88	5.2.1 The eikonal approximation	177
3.3.2 Some numerical results	94	5.2.2 The WKB approximation	190
3.3.3 Partial-wave expansion of $\phi_C^{(+)}(\mathbf{k}; \mathbf{r})$	97	5.2.3 The semiclassical scattering amplitude	211
3.4 Coulomb plus short-range potentials	98	6. Spin and Identical Particles	247
3.4.1 An illustration: $\alpha - \alpha$ scattering	102	6.1 Collisions of particles with spin	247
4. Green's Functions, T- and S-Matrices	107	6.1.1 Partial-wave expansions	250
4.1 Lippmann-Schwinger equations	107	6.2 The scattering of a spin $1/2$ particle	262
4.1.1 The free particle Green's function	109	6.2.1 The eikonal approximation in collisions of a spin- $1/2$ particle	269
4.1.2 The scattering amplitude	113	6.3 Identical particles	273
4.1.3 Orthonormality relation for scattering states	115	6.3.1 Collisions of identical spinless particles and particles with aligned spins	275
4.1.4 The Møller wave operators	116	6.3.2 Collisions of identical particles with spin	280
4.2 The transition and the scattering operators	117	6.3.3 Clusters of identical fermions	284
4.2.1 The Optical Theorem	119		
4.2.2 The S-matrix	120		

7.	Scattering from Complex Potentials	291	9.3	Partial-wave expansions	399
7.1	The absorption cross section	291	9.3.1	Collisions of spinless particles	399
7.2	Lippmann-Schwinger equations with complex potentials .	296	9.3.2	Partial-wave expansions with spin	409
7.3	The scattering and the transition operators	301	9.3.3	Evaluation of matrix-elements	419
7.3.1	Low's equation and the generalized Optical Theorem	303	9.4	Coupling with continuum states	424
7.4	Partial-wave expansions	305	9.5	Solution of the coupled channel equations	431
7.5	Diffractive scattering	307	10.	Few-channel Description of Many-body Scattering	441
7.5.1	Fraunhofer diffraction	308	10.1	The Feshbach calculus	442
7.5.2	Fresnel diffraction	315	10.1.1	The dispersion relation for \mathbb{H}_{eff}	445
7.6	Realistic treatments of elastic scattering with absorptive potentials	323	10.2	Prompt processes, time delay and resonances	446
8.	Additional Topics	341	10.2.1	Prompt processes: direct reactions	447
8.1	Analytical properties of the S-matrix	341	10.2.2	Long-lived resonances	448
8.1.1	The Jost function	341	10.3	Energy averages and the optical model	459
8.1.2	Analytical continuation in the complex k - and E -planes	343	10.4	Optical potentials	464
8.1.3	Bound states	346	10.4.1	Optical potentials in nucleon-nucleus collisions .	465
8.1.4	Resonances	350	10.4.2	Optical potentials in nucleus-nucleus collisions .	473
8.1.5	Analytical continuation into the complex l -plane .	353	10.5	Dynamic polarization potentials	487
8.2	Quantum scattering in 1D and 2D	355	10.5.1	Adiabatic polarization potentials	490
8.2.1	Brief account of quantum scattering in 1D	356	10.5.2	Polarization potentials in the sudden limit	498
8.2.2	Brief account of quantum scattering in 2D	360	10.5.3	Realistic polarization potentials	507
8.2.3	Semiclassical scattering in 2D	368	10.5.4	Threshold anomaly	509
8.3	The inverse scattering problem	373	10.6	Scattering from energy-dependent potentials	512
8.4	The Calogero equation for neutral particle scattering . .	377	11.	Approximate Methods in Many-body Scattering	517
8.4.1	The Calogero equation for charged particle scattering	380	11.1	Perturbative approximations	518
Part 2: Many-body Scattering		383	11.1.1	The Plane Waves Born Approximation	519
9.	The Coupled Channel Formalism	385	11.1.2	The Distorted Waves Born Approximation	521
9.1	The close coupling approximation	388	11.1.3	The Coupled Channel Born Approximation	523
9.1.1	Absorption in multi-channel scattering	391	11.2	Semiclassical approximations	524
9.2	The Lippmann-Schwinger equations	393	11.2.1	The classical trajectory approximation	524
9.2.1	Møller operators, the T- and the S-matrices . . .	397	11.2.2	The classical-limit S-matrix	538
			11.2.3	Glauber approximation	545
			12.	Selected Topics in Many-body Scattering	551
			12.1	Doorway resonances	551
			12.2	Feshbach resonances in atom-atom collisions	563

12.3	Statistical treatment of complex scattering: the compound nucleus	568
12.3.1	Fluctuation cross section	576
12.3.2	Fluctuation part of angular distributions	581
12.4	Chaotic scattering	585
12.4.1	Ericson fluctuations	585
12.4.2	Hanbury Brown-Twiss correlations	588
12.5	Scattering in media and nuclear astrophysics	593
12.6	Multiple scattering	600
12.7	The three-body problem and Faddeev equations	603
12.8	The R-matrix method	606
12.8.1	The calculable R-matrix	607
12.8.2	The phenomenological R-matrix	611
	<i>Bibliography</i>	613
	<i>Index</i>	625
