<i>Foreword</i>	ix
<i>Preface</i>	xiii
1. Overview of Atomistic Mechanics	1
1.1 Newton's, Lagrange's, and Hamilton's Mechanics	1
1.2 Controlling Mechanical Boundaries	5
1.3 Controlling Thermal Boundaries	9
1.4 Gibbs' Statistical Mechanics	10
1.5 Nosé-Hoover Control of Kinetic Temperature	14
1.6 Nonequilibrium Multifractal Distributions	16
1.7 Nonlinear Transport	18
1.8 Time-Reversible Thermostats and Thermometers	19
1.9 Upcoming Background for Our Numerical Examples	21
1.10 Summary	22
1.11 References	22
1.12 Problems	24
2. Formulating Atomistic Simulations	25
2.1 Newton's Mechanics for Many-Body Particle Systems	25
2.2 Lagrange's Mechanics for Systems with Constraints	30
2.3 Hamilton's Mechanics and Liouville's Theorem	34
2.4 Time-Reversible Leapfrog Algorithm	37
2.5 Energy Control by Gauss or Lagrange or Hamilton	39
2.5.1 Gauss' Principle of Least-Constraint $\rightarrow K = K_0$	39
2.5.2 Applying a Lagrange Multiplier $\rightarrow K = K_0$	40
2.5.3 Using Hamilton's Least-Action Principle $\rightarrow K = K_0$	43

2.6	Boundary Conditions—Virial and Heat Theorems	44	4.10	Problems	100
2.7	Smooth-Particle Averages of Atomistic Properties	46	5.	Numerical Molecular Dynamics and Chaos	103
2.8	Constraints and Gibbs' Entropy	49	5.1	Formulations of Particle Mechanics	103
2.9	Summary	50	5.2	Leapfrog Method and the "Velocity-Verlet Algorithm"	104
2.10	References	50	5.3	Runge-Kutta Integration Method	107
2.11	Problems	51	5.4	Finite-Precision Solutions and Periodic Orbits	110
3.	Thermodynamics, Statistical Mechanics, and Temperature	53	5.5	Levesque and Verlet's Bit-Reversible Algorithm	111
3.1	Thermodynamics and Ideal-Gas Temperature	53	5.5.1	Bit-Reversible Harmonic Oscillator	112
3.2	Thermodynamics of the Classical Ideal Gas	55	5.6	Optimized Symplectic Algorithms - Time Reversibility	114
3.3	The Three Laws of Thermodynamics	56	5.7	Ergodicity and Lyapunov Instability with $\{\dot{q}, \dot{p}, \dot{\zeta}, \dot{\xi}\}$	116
3.3.1	The Zeroth Law of Thermodynamics	57	5.7.1	The $\{\dot{q}, \dot{p}, \dot{\zeta}\}$ Model \rightarrow Mixed Chaos and Regularity	117
3.3.2	The First Law of Thermodynamics	58	5.7.2	Two $\{\dot{q}, \dot{p}, \dot{\zeta}, \dot{\xi}\}$ Models \rightarrow Four-Dimensional Chaos	120
3.3.3	The Paradoxical Second Law of Thermodynamics	60	5.7.3	Dimensionality Loss in Oscillator Problems	122
3.4	Temperature from Gibbs' Entropy and Jaynes' Failure	64	5.7.4	Characterizing Chaos for the $\{\dot{q}, \dot{p}, \dot{\zeta}, \dot{\xi}\}$ Models	123
3.5	Nosé's Picture of Gibbs' Canonical Ensemble	68	5.7.5	Characterizing Chaos for a Hamiltonian Cell Model	124
3.6	Two Canonical-Ensemble Temperatures, T_K and T_C	70	5.8	Lyapunov Instability Algorithm for Many Bodies	127
3.7	Kinetic Theory Temperature ; Ideal-Gas Thermometer	71	5.8.1	Lyapunov Instability for Thirty-Eight Bodies	129
3.8	Anisotropic Temperature from Hard Parallel Cubes	73	5.8.2	Lyapunov Instability for Fourteen Bodies	133
3.9	Summary	73	5.8.3	Benettin's N -Body Lyapunov-Spectrum Algorithm	135
3.10	References	74	5.8.4	Vector Rotation, Covariance, and Scale Dependence	137
3.11	Problems	74	5.8.5	Coordinate Dependence of Oscillator Spectra	139
4.	Continuum Mechanics: Continuity, Stress, Heat Flux, Applications	77	5.9	Summary	141
4.1	Mechanics from the Continuum Viewpoint	77	5.10	References	142
4.2	Conservation of Mass, Momentum, and Energy	79	5.11	Problems	143
4.2.1	Eulerian and Lagrangian Continuity Equations	79	6.	Time-Reversible Atomistic Thermostats	145
4.2.2	Eulerian and Lagrangian Motion Equations, Pressure	80	6.1	Temperature, Contact Temperature, and Thermostats	145
4.2.3	Heat Flux and the Energy Equations	83	6.2	Nosé's Hamiltonian Thermostats	151
4.3	Smooth-Particle Simulation of Continua	85	6.2.1	More General Thermostat Forms	153
4.4	Constitutive Relations and "Entropy Production"	87	6.2.2	Oscillators—Nosé and Nosé-Hoover Thermostating	154
4.5	Free Expansion Within a Square 128×128 Container	89	6.3	Nonequilibrium Nosé-Hoover Oscillator	157
4.6	Oscillation of a Two-Dimensional Drop	92	6.4	Patra-Bhattacharya Thermostat	160
4.7	Shockwaves and Fluxes, Irreversibility, Time Delay	93	6.4.1	Patra-Bhattacharya Oscillator	161
4.7.1	A Simple Model for Shockwave Structure	96	6.5	Campisi's Logarithmic Hamiltonian Thermostat	163
4.7.2	Irreversibility, Time Delay, Locality	97	6.6	Hoover-Leete Isokinetic Hamiltonian Thermostat	165
4.8	Summary	99	6.7	Landau-Lifshitz' Configurational Thermostat	168
4.9	References	99	6.8	Feedback — Gaussian and Nosé-Hoover Thermostats	169

6.9	Two-Moment, Three-Moment, and Chain Thermostats . . .	170
6.10	Time-Reversible Stochastic Thermostats ?	174
6.10.1	Time-Reversible Brownian Dynamics !	176
6.11	Ergostats, Barostats ,	177
6.12	Summary	178
6.13	References	179
6.14	Problems	179
7.	Key Results from Nonequilibrium Simulations	181
7.1	Prototypical Nonequilibrium Simulations	181
7.1.1	Early Equilibrium Simulations	182
7.1.2	Nonequilibrium Simulations	183
7.1.3	Green-Kubo Perturbation Theory of Transport	186
7.2	Periodic Shear with the Doll’s and Sllod Algorithms	188
7.2.1	The Doll’s Algorithm	188
7.2.2	The Sllod Algorithm	190
7.3	Boundary-Driven Shear Flows	191
7.3.1	High-Strain-Rate Deformation of Solids	194
7.4	Green-Kubo and Homogeneous Heat-Flow Simulations	195
7.5	Boundary-Driven Simulations of Periodic Heat Flow	198
7.6	The ϕ^4 Model and Phase-Space Dimensionality Loss	199
7.7	Phase-Space Attractor Dimensionality Loss	204
7.7.1	Fractal Information Dimension	206
7.8	Mesoscopic Reversibility through SPAM Interpolation	208
7.9	Shockwaves and Their Smooth-Particle Representation	209
7.10	Shockwaves, Tensor Temperature, and Time Delay	212
7.10.1	Evolution of a Sinusoidal Shockwave	212
7.10.2	Analysis of a Planar Shockwave Profile	214
7.11	The Simplest Continuum Models for a Shockwave	217
7.12	More Complex Continuum Models for a Shockwave	219
7.13	Summary	220
7.14	References	221
7.15	Problems	222
8.	Second Law, Reversibility, Instability	223
8.1	Time Reversibility: Boltzmann, Loschmidt, Zermélo	223
8.2	Second Law for Hamiltonian Systems	227
8.3	Second Law for Thermostated Systems	231

8.4	Computational Averaging, Ergodicity, and Recurrence	233
8.5	Thermostated Ergodic Galton Board	236
8.6	Thermostated Ergodic Harmonic Oscillators	245
8.7	Nonequilibrium Oscillator Limit-Cycle Stability	248
8.8	Illustration of Hamiltonian Exponent Pairing	250
8.8.1	Single Oscillator and Single Diatomic	251
8.8.2	Time-Reversible Collision of Two Diatomics	252
8.8.3	Spectra of Colliding Quiet Diatomics	255
8.9	Lyapunov Instability of Many-Body Systems	257
8.10	Antique Dogs and Stochastic Fleas	259
8.11	Summary	261
8.12	References	262
8.13	Problems	264
9.	Outlook for Progress and Life on Earth	265
9.1	Introduction – Modelling Water and Real Life	265
9.2	Computational Models for Water	266
9.2.1	Bernal-Fowler Mechanical Model for Water (1933)	267
9.2.2	Abascal and Vega’s Model for Water (2005)	269
9.2.3	Feynman’s Path Integrals (1948)	273
9.2.4	Wigner-Kirkwood <i>versus</i> Feynman (1932-1948)	274
9.2.5	The Car-Parrinello Lagrangian (1985)	275
9.2.6	Thomas-Fermi (1927) \rightarrow Density Functional Theory	275
9.2.7	Modern “Multiscale” Simulations	276
9.3	2013 Chemistry Prize: Karplus, Levitt, Warshel	277
9.4	How Did the Building Blocks of Life Emerge and Grow?	278
9.5	Stanley Miller and Harold Urey’s Experiment (1953)	279
9.6	Computer Simulations and Corroborating Experiments	280
9.7	Computational Biochemistry and Drug Design	282
9.7.1	Drug Treatments for Diabetes	284
9.8	Summary	286
9.9	References	287
9.10	Problems	287
