

Table of Contents

About the Cover	xv
Preface	xvii
PART I Thermodynamics	1
1 Introduction	3
1.1 Temperature	3
1.2 Thermodynamics Versus Statistical Mechanics	5
1.3 Classification of State Variables	6
1.4 Energy in Mechanics	8
1.5 Elementary Kinetic Theory	12
2 First Law of Thermodynamics	15
2.1 Statement of the First Law	15
2.2 Quasistatic Work	17
2.3 Heat Capacities	19
2.4 Work Due to Expansion of an Ideal Gas	24
2.5 Enthalpy	28
3 Second Law of Thermodynamics	31
3.1 Statement of the Second Law	32
3.2 Carnot Cycle and Engines	35
3.3 Calculation of the Entropy Change	39
3.4 Combined First and Second Laws	41
3.5 Statistical Interpretation of Entropy	47

4	Third Law of Thermodynamics	49	9	Two-Phase Equilibrium for a van der Waals Fluid	121
4.1	Statement of the Third Law	49	9.1	van der Waals Equation of State	121
4.2	Implications of the Third Law	50	9.2	Thermodynamic Functions	124
5	Open Systems	53	9.3	Phase Equilibrium and Miscibility Gap	127
5.1	Single Component Open System	53	9.4	Gibbs Free Energy	131
5.2	Multicomponent Open Systems	55	10	Binary Solutions	137
5.3	Euler Theorem of Homogeneous Functions	59	10.1	Thermodynamics of Binary Solutions	137
5.4	Chemical Potential of Real Gases, Fugacity	64	10.2	Ideal Solutions	142
5.5	Legendre Transformations	67	10.3	Phase Diagram for an Ideal Solid and an Ideal Liquid	145
5.6	Partial Molar Quantities	71	10.4	Regular Solution	148
5.7	Entropy of Chemical Reaction	75	10.5	General Binary Solutions	153
6	Equilibrium and Thermodynamic Potentials	79	11	External Forces and Rotating Coordinate Systems	155
6.1	Entropy Criterion	79	11.1	Conditions for Equilibrium	155
6.2	Energy Criterion	84	11.2	Uniform Gravitational Field	157
6.3	Other Equilibrium Criteria	88	11.3	Non-Uniform Gravitational Field	164
6.4	Summary of Criteria	92	11.4	Rotating Systems	164
7	Requirements for Stability	95	11.5	Electric Fields	166
7.1	Stability Requirements for Entropy	95	12	Chemical Reactions	167
7.2	Stability Requirements for Internal Energy	100	12.1	Reactions at Constant Volume or Pressure	168
7.3	Stability Requirements for Other Potentials	102	12.2	Standard States	171
7.4	Consequences of Stability Requirements	105	12.3	Equilibrium and Affinity	173
7.5	Extension to Many Variables	106	12.4	Explicit Equilibrium Conditions	175
7.6	Principles of Le Chatlier and Le Chatlier-Braun	107	12.5	Simultaneous Reactions	182
8	Monocomponent Phase Equilibrium	109	13	Thermodynamics of Fluid-Fluid Interfaces	185
8.1	Clausius-Clapeyron Equation	110	13.1	Planar Interfaces in Fluids	186
8.2	Sketches of the Thermodynamic Functions	115	13.2	Curved Interfaces in Fluids	197
8.3	Phase Diagram in the v, p Plane	118			

13.3 Interface Junctions and Contact Angles	202	18 Distinguishable Particles with Negligible Interaction Energies	285
13.4 Liquid Surface Shape in Gravity	205	18.1 Derivation of the Boltzmann Distribution	285
14 Thermodynamics of Solid-Fluid Interfaces	215	18.2 Two-State Subsystems	289
14.1 Planar Solid-Fluid Interfaces	216	18.3 Harmonic Oscillators	293
14.2 Anisotropy of γ	221	18.4 Rigid Linear Rotator	303
14.3 Curved Solid-Fluid Interfaces	227	19 Canonical Ensemble	305
14.4 Faceting of a Large Planar Face	233	19.1 Three Derivations	305
14.5 Equilibrium Shape from the ξ -Vector	236	19.2 Factorization Theorem	312
14.6 Herring Formula	240	19.3 Classical Ideal Gas	313
14.7 Legendre Transform of the Equilibrium Shape	241	19.4 Maxwell-Boltzmann Distribution	317
14.8 Remarks About Solid-Solid Interfaces	242	19.5 Energy Dispersion	320
PART II Statistical Mechanics	245	19.6 Paramagnetism	321
15 Entropy and Information Theory	247	19.7 Partition Function and Density of States	330
15.1 Entropy as a Measure of Disorder	247	20 Classical Canonical Ensemble	337
15.2 Boltzmann Eta Theorem	251	20.1 Classical Ideal Gas	338
16 Microcanonical Ensemble	257	20.2 Law of Dulong and Petit	342
16.1 Fundamental Hypothesis of Statistical Mechanics	258	20.3 Averaging Theorem and Equipartition	343
16.2 Two-State Subsystems	261	20.4 Virial Theorem	346
16.3 Harmonic Oscillators	265	20.5 Virial Coefficients	348
16.4 Ideal Gas	267	20.6 Use of Canonical Transformations	354
16.5 Multicomponent Ideal Gas	273	20.7 Rotating Rigid Polyatomic Molecules	356
17 Classical Microcanonical Ensemble	277	21 Grand Canonical Ensemble	359
17.1 Liouville's Theorem	278	21.1 Derivation from Microcanonical Ensemble	360
17.2 Classical Microcanonical Ensemble	280	21.2 Ideal Systems: Orbitals and Factorization	368

21.3	Classical Ideal Gas with Internal Structure	380	26.3	Random Phases and External Influence	454
21.4	Multicomponent Systems	388	26.4	Time Evolution	455
21.5	Pressure Ensemble	389	26.5	Density Operators for Specific Ensembles	456
22	Entropy for Any Ensemble	397	26.6	Examples of the Density Matrix	459
22.1	General Ensemble	397	26.7	Indistinguishable Particles	465
22.2	Summation over Energy Levels	402	27	Ising Model	469
23	Unified Treatment of Ideal Fermi, Bose, and Classical Gases	405	27.1	Ising Model, Mean Field Treatment	470
23.1	Integral Formulae	406	27.2	Pair Statistics	477
23.2	The Functions $h_v(\lambda, a)$	408	27.3	Solution in One Dimension for Zero Field	479
23.3	Virial Expansions for Ideal Fermi and Bose Gases	410	27.4	Transfer Matrix	480
23.4	Heat Capacity	412	27.5	Other Methods of Solution	483
24	Bose Condensation	413	27.6	Monte Carlo Simulation	484
24.1	Bosons at Low Temperatures	413	PART III Appendices	495	
24.2	Thermodynamic Functions	416	A Stirling's Approximation	497	
24.3	Condensate Region	421	A.1 Elementary Motivation of Eq. (A.1)	498	
25	Degenerate Fermi Gas	425	A.2 Asymptotic Series	499	
25.1	Ideal Fermi Gas at Low Temperatures	425	B Use of Jacobians to Convert Partial Derivatives	503	
25.2	Free Electron Model of a Metal	428	B.1 Properties of Jacobians	503	
25.3	Thermal Activation of Electrons	429	B.2 Connection to Thermodynamics	504	
25.4	Pauli Paramagnetism	433	C Differential Geometry of Surfaces	509	
25.5	Landau Diamagnetism	436	C.1 Alternative Formulae for ξ Vector	509	
25.6	Thermionic Emission	439	C.2 Surface Differential Geometry	511	
25.7	Semiconductors	442	C.3 ξ Vector for General Surfaces	516	
26	Quantum Statistics	451	C.4 Herring Formula	518	
26.1	Pure States	451	D Equilibrium of Two-State Systems	523	
26.2	Statistical States	453			

E Aspects of Canonical Transformations	529
E.1 Necessary and Sufficient Conditions	530
E.2 Restricted Canonical Transformations	534
F Rotation of Rigid Bodies	537
F.1 Moment of Inertia	537
F.2 Angular Momentum	539
F.3 Kinetic Energy	540
F.4 Time Derivatives	540
F.5 Rotating Coordinate System	541
F.6 Matrix Formulation	544
F.7 Canonical Variables	546
F.8 Quantum Energy Levels for Diatomic Molecule	547
G Thermodynamic Perturbation Theory	549
G.1 Classical Case	549
G.2 Quantum Case	550
H Selected Mathematical Relations	553
H.1 Bernoulli Numbers and Polynomials	553
H.2 Euler-Maclaurin Sum Formula	554
I Creation and Annihilation Operators	559
I.1 Harmonic Oscillator	559
I.2 Boson Operators	560
I.3 Fermion Operators	562
I.4 Boson and Fermion Number Operators	563
References	565
Index	569
