

CONTENTS

1. What's in This Book (Read This First!)	1
1.1 Real people can read this book	1
1.2 What's in this book	3
1.3 What's new in the second edition?	6
1.4 Gimme feedback (be polite)	8
1.5 Thank you!	8
PART I The Basics: Models, Probability, Bayes' Rule, and R	13
2. Introduction: Credibility, Models, and Parameters	15
2.1 Bayesian inference is reallocation of credibility across possibilities	16
2.2 Possibilities are parameter values in descriptive models	22
2.3 The steps of bayesian data analysis	25
2.4 Exercises	31
3. The R Programming Language	33
3.1 Get the software	35
3.2 A simple example of R in action	36
3.3 Basic commands and operators in R	38
3.4 Variable types	42
3.5 Loading and saving data	53
3.6 Some utility functions	56
3.7 Programming in R	61
3.8 Graphical plots: opening and saving	69
3.9 Conclusion	69
3.10 Exercises	70
4. What Is This Stuff Called Probability?	71
4.1 The set of all possible events	72
4.2 Probability: outside or inside the head	73
4.3 Probability distributions	78
4.4 Two-way distributions	89
4.5 Appendix: R code for figure 4.1	93
4.6 Exercises	95

5. Bayes' Rule	99	9. Hierarchical Models	221
5.1 Bayes' rule	100	9.1 A single coin from a single mint	223
5.2 Applied to parameters and data	105	9.2 Multiple coins from a single mint	230
5.3 Complete examples: estimating bias in a coin	108	9.3 Shrinkage in hierarchical models	245
5.4 Why Bayesian inference can be difficult	115	9.4 Speeding up JAGS	249
5.5 Appendix: R code for figures 5.1, 5.2, etc.	116	9.5 Extending the hierarchy: subjects within categories	251
5.6 Exercises	118	9.6 Exercises	260
 PART II All the Fundamentals Applied to Inferring a Binomial Probability	 121	 10. Model Comparison and Hierarchical Modeling	 265
6. Inferring a Binomial Probability via Exact Mathematical Analysis	123	10.1 General formula and the Bayes factor	266
6.1 The likelihood function: Bernoulli distribution	124	10.2 Example: two factories of coins	268
6.2 A description of credibilities: the beta distribution	126	10.3 Solution by MCMC	274
6.3 The posterior beta	132	10.4 Prediction: model averaging	289
6.4 Examples	134	10.5 Model complexity naturally accounted for	289
6.5 Summary	138	10.6 Extreme sensitivity to prior distribution	292
6.6 Appendix: R code for figure 6.4	138	10.7 Exercises	295
6.7 Exercises	139	 11. Null Hypothesis Significance Testing	 297
7. Markov Chain Monte Carlo	143	11.1 Paved with good intentions	300
7.1 Approximating a distribution with a large sample	145	11.2 Prior knowledge	315
7.2 A simple case of the Metropolis algorithm	146	11.3 Confidence interval and highest density interval	317
7.3 The Metropolis algorithm more generally	156	11.4 Multiple comparisons	325
7.4 Toward Gibbs sampling: estimating two coin biases	162	11.5 What a sampling distribution <i>is</i> good for	329
7.5 MCMC representativeness, accuracy, and efficiency	178	11.6 Exercises	331
7.6 Summary	188	 12. Bayesian Approaches to Testing a Point ("Null") Hypothesis	 335
7.7 Exercises	189	12.1 The estimation approach	336
8. JAGS	193	12.2 The model-comparison approach	343
8.1 JAGS and its relation to R	193	12.3 Relations of parameter estimation and model comparison	352
8.2 A complete example	195	12.4 Estimation or model comparison?	354
8.3 Simplified scripts for frequently used analyses	206	12.5 Exercises	355
8.4 Example: difference of biases	208	 13. Goals, Power, and Sample Size	 359
8.5 Sampling from the prior distribution in JAGS	211	13.1 The will to power	360
8.6 Probability distributions available in JAGS	213	13.2 Computing power and sample size	366
8.7 Faster sampling with parallel processing in RunJAGS	215	13.3 Sequential testing and the goal of precision	383
8.8 Tips for expanding JAGS models	218	13.4 Discussion	393
8.9 Exercises	218	13.5 Exercises	396

14. Stan	399
14.1 HMC sampling	400
14.2 Installing Stan	407
14.3 A complete example	407
14.4 Specify models top-down in Stan	414
14.5 Limitations and extras	415
14.6 Exercises	415
PART III The Generalized Linear Model	417
15. Overview of the Generalized Linear Model	419
15.1 Types of variables	420
15.2 Linear combination of predictors	423
15.3 Linking from combined predictors to noisy predicted data	435
15.4 Formal expression of the GLM	444
15.5 Exercises	446
16. Metric-Predicted Variable on One or Two Groups	449
16.1 Estimating the mean and standard deviation of a normal distribution	450
16.2 Outliers and robust estimation: the t distribution	458
16.3 Two groups	468
16.4 Other noise distributions and transforming data	472
16.5 Exercises	473
17. Metric Predicted Variable with One Metric Predictor	477
17.1 Simple linear regression	478
17.2 Robust linear regression	479
17.3 Hierarchical regression on individuals within groups	490
17.4 Quadratic trend and weighted data	495
17.5 Procedure and perils for expanding a model	501
17.6 Exercises	504
18. Metric Predicted Variable with Multiple Metric Predictors	509
18.1 Multiple linear regression	510
18.2 Multiplicative interaction of metric predictors	525
18.3 Shrinkage of regression coefficients	530
18.4 Variable selection	536
18.5 Exercises	549

19. Metric Predicted Variable with One Nominal Predictor	553
19.1 Describing multiple groups of metric data	554
19.2 Traditional analysis of variance	556
19.3 Hierarchical Bayesian approach	557
19.4 Including a metric predictor	568
19.5 Heterogeneous variances and robustness against outliers	573
19.6 Exercises	579
20. Metric Predicted Variable with Multiple Nominal Predictors	583
20.1 Describing groups of metric data with multiple nominal predictors	584
20.2 Hierarchical Bayesian approach	588
20.3 Rescaling can change interactions, homogeneity, and normality	599
20.4 Heterogeneous variances and robustness against outliers	602
20.5 Within-subject designs	606
20.6 Model comparison approach	616
20.7 Exercises	618
21. Dichotomous Predicted Variable	621
21.1 Multiple metric predictors	622
21.2 Interpreting the regression coefficients	629
21.3 Robust logistic regression	635
21.4 Nominal predictors	636
21.5 Exercises	646
22. Nominal Predicted Variable	649
22.1 Softmax regression	650
22.2 Conditional logistic regression	655
22.3 Implementation in JAGS	659
22.4 Generalizations and variations of the models	667
22.5 Exercises	668
23. Ordinal Predicted Variable	671
23.1 Modeling ordinal data with an underlying metric variable	672
23.2 The case of a single group	675
23.3 The case of two groups	682
23.4 The case of metric predictors	685
23.5 Posterior prediction	698
23.6 Generalizations and extensions	699
23.7 Exercises	700

24. Count Predicted Variable	703
24.1 Poisson exponential model	704
24.2 Example: hair eye go again	711
24.3 Example: interaction contrasts, shrinkage, and omnibus test	713
24.4 Log-linear models for contingency tables	715
24.5 Exercises	715
25. Tools in the Trunk	721
25.1 Reporting a Bayesian analysis	721
25.2 Functions for computing highest density intervals	725
25.3 Reparameterization	729
25.4 Censored data in JAGS	732
25.5 What next?	736
<i>Bibliography</i>	737
<i>Index</i>	747
