Preface **v**

Chapter 1. Metals and Nonmetals **1**
1.1 The '***macroscopic***' and '***microscopic***' world 1
1.1.1 Three stages of the '***microscopic***' world 1
1.1.2 Condensed matter physics 2
1.1.3 ***Macroscopic*** measurements 3
1.1.4 Electric conductivity as a probe to analyze the microscopic world 3
1.2 The magnitude of electric conductivity and resistivity 5
1.2.1 *Metals* 7
1.2.2 *Insulators* 7
1.2.3 *Semimetals* 8
1.2.4 *Semiconductors* 8
1.3 Existence of free electrons 8
1.3.1 What indeed is a metal? 9
1.3.2 What kinds of materials belong to the group of metals? 12
1.3.3 Characteristic features of metals 15

Chapter 2. Electron Theory of Metals and The Band Theory **17**
2.1 The Drude theory of electrons 17
2.1.1 Number of '***free electrons***' 18
2.1.2 Electric conductivity of direct current 19
2.1.3 The Hall coefficient 22
2.1.4 Electric conductivity of alternating current 24
2.2 Fermi Gas 28
2.2.1 The Fermi-Dirac Distribution 28
2.2.2 The Boltzmann equation 32

2.2.3 Conditions that a material be a metal. 35
2.3 The band theory 37
2.3.1 The Bloch electrons 37
2.3.2 Demonstration of the Schrödinger equation in terms of the reciprocal lattice vectors. 38
2.3.3 Energy bands 41
2.3.4 Effective mass 45
2.4 The temperature dependence of electric resistivity of a metal. 47
2.4.1 Evaluation of the temperature dependence 47
2.4.2 Comparison between a metal and a nonmetal 51
2.4.3 Discontinuity of the electric resistance at the melting point 51
2.5 Metal-nonmetal transitions 53

Chapter 3. Peierls Transition: Metal-Nonmetal Transition due to the Change of Periodicity 59
3.1 What happens when the periodicity of a crystal changes? 60
3.1.1 The case in which the periodicity is doubled. 60
3.1.2 The case in which the periodicity is tripled and the cases for the other periodicity. 65
3.2 Density response function 66
3.2.1 Derivation of the density auto-correlation function 68
3.2.2 The density auto-correlation function at the absolute zero. 70
3.2.3 Influence of the finite temperature 73
3.3 Order parameter 76
3.3.1 The total energy of a one-dimensional system at the absolute zero. 77
3.3.2 The width of the energy gap at the absolute zero. 80
3.3.3 The gap equation 82
3.4 Peierls transition in realistic materials 88
3.4.1 Peierls insulator 88
3.4.2 Charge density wave 93
3.4.3 Commensurability 97
3.4.4 Electric conduction in TTF-TCNQ 98
3.4.5 Metallization of organic materials under pressure 102

Chapter 4. Bloch-Wilson Transition Type I: Metal-Nonmetal Transition due to the Band Overlap – Part 1 105
4.1 The mechanism of the band overlap – Part 1 105
4.1.1 ***Isolated*** atom and ***polyatomic*** molecule 105
4.1.2 The tight-binding approximation — derivation of general equations 111
4.1.3 One-dimensional and three-dimensional crystals 113
4.1.4 The broadening of bands and the band overlap 120
4.1.5 The energy bands of some element metals 125
4.1.6 Bloch-Wilson transition — Type I and Type II 128
4.2 Bloch-Wilson transition – Type I 133
4.2.1 Black phosphorus 134
4.2.2 Iodine 144
4.2.3 Bromine 153
4.2.4 Mercury 160

Chapter 5. Bloch-Wilson Transition Type II: Metal-Nonmetal Transition due to the Band Overlap – Part 2 169
5.1 The mechanism of the band overlap – Part 2 169
5.1.1 The level difference $\Delta\varepsilon_{\mu+1,\mu}$ – both (1) when $\Delta\varepsilon_{\mu+1,\mu}$ is nearly constant and (2) when it is variable. 169
5.1.2 The origin of the energy level difference 171
5.1.3 The difference of levels depends on the interatomic distance 172
5.2 The Bloch-Wilson transition of the type II 176
5.2.1 Element materials in group 14 176
5.2.2 Expanded selenium 179
5.2.3 Se at high temperature and pressure 190

Chapter 6. Anderson Transition: Metal-Nonmetal Transition due to Disorder 203
6.1 The Anderson localization 204
6.1.1 The absence of diffusion in certain random lattices 204
6.1.2 The tight-binding representation 206
6.1.3 The theory of the Anderson localization 209
6.2 The scaling theory 218
6.2.1 The Thouless number 218

6.2.2 Theory of the renormalization group 220
6.3 The mobility edge 224
6.3.1 Metal-nonmetal transition 224
6.3.2 The critical exponent 228
6.4 The concept of the Anderson localization 231

Chapter 7. Mott Transition: Metal-Nonmetal Transition due to Electron Correlation 233
7.1 A system with a partially-filled band 233
7.2 The Hubbard theory 238
7.3 Strongly-correlated electron systems 243
7.3.1 The phase diagrams on the $(x_e, 2\mathcal{V}/\mathcal{I})$ plane and on the $(x_h, 2\mathcal{V}/\mathcal{I})$ plane 243
7.3.2 The phase diagrams on the (x_h, T) plane 245
7.3.3 The conditions for the occurrence of the Mott insulator-to-metal transition 246
7.4 The Mott transition and the Anderson localization 248
7.5 Fluids under high temperature and high pressure 253

Chapter 8. Postscript 257

Chapter 9. Appendices 261
A The reciprocal lattice 261
B Metal-nonmetal transition by the percolation mechanism 264
C The evaluation of the density auto-correlation function at the absolute zero temperature 271
D Evaluation of the integrals used in the discussion of the Peierls transition 277
E The primitive vectors and other properties in 1D and 3D crystals 287
F Electronic energy in the tight-binding approximation 292

Bibliography 297
