Contents

	Preface	v
	Contents	vii
	List of symbols	xi
	1. What is light?	1
	A brief excursion into history and a preview on the content of this book	1
1.1.	The wave–particle controversy	1
1.2.	Geometrical optics	1
1.3.	Waves	3
1.4.	The oscillator model of matter	4
1.5.	The early quantum theory of matter and light	8
1.6.	Quantum mechanics	12
1.7.	An important intermediate step: The semiclassical approach	14
1.8.	Quantization of the electromagnetic field: Quantum electrodynamics (QED)	16
1.9.	The wave–particle dualism in quantum mechanics	18
1.10.	The wave–particle dualism in quantum optics	21
1.11.	Coherence in classical optics and in quantum optics	24
1.12.	Spontaneous emission and quantum noise	28
1.13.	Damping and fluctuations of quantum systems	29
1.14.	Photon numbers and phases. Coherent states.	31
1.15.	The crisis of quantum electrodynamics and how it was solved	32
1.16.	How this book is organized	34
1.17.	Laser and nonlinear optics	34

2. The nature of light: Waves or particles? 37
2.1. Waves 37
2.2. Classical coherence functions 44
2.3. Planck's radiation law 50
2.4. Particles of light: Photons 56
2.5 Einstein's derivation of Planck's law 58

3. The nature of matter. Particles or waves? 63
3.1. A wave equation for matter: The Schrödinger equation 63
3.2. Measurements in quantum mechanics and expectation values 71
3.3. The harmonic oscillator 80
3.4. The hydrogen atom 93
3.5. Some other quantum systems 102
3.6. Electrons in crystalline solids 104
3.7. Nuclei 110
3.8. Quantum theory of electron and proton spin 112

4. Response of quantum systems to classical electromagnetic oscillations 119
4.1. An example. A two-level atom exposed to an oscillating electric field 119
4.2. Interaction of a two-level system with incoherent light. The Einstein coefficients 122
4.3. Higher-order perturbation theory 126
4.4. Multi-quantum transitions. Two-photon absorption 130
4.5. Non-resonant perturbations. Forced oscillations of the atomic dipole moment. Frequency mixing 133
4.6. Interaction of a two-level system with resonant coherent light 137
4.7. The response of a spin to crossed constant and time dependent magnetic fields 141
4.8. The analogy between a two-level atom and a spin $\frac{1}{2}$ 145
4.9. Coherent and incoherent processes 155

5. Quantization of the light field 157
5.1. Example: A single mode. Maxwell's equations 157
5.2. Schrödinger equation for a single mode 164
5.3. Some useful relations between creation and annihilation operators 165
5.4. Solution of the time dependent Schrödinger equation for a single field mode. Wave packets 169
5.5. Coherent states 170
5.6. Time-dependent operators. The Heisenberg picture 174

5.7. The forced harmonic oscillator in the Heisenberg picture 178
5.8. Quantization of light field: The general multimode case 179
5.9. Uncertainty relations and limits of measurability 189

6. Quantization of electron wave field 195
6.1. Motivation 195
6.2. Quantization procedure 196

7. The interaction between light field and matter 201
7.1. Introduction: Different levels of description 201
7.2. Interaction field–matter: Classical Hamiltonian, Hamiltonian operator, Schrödinger equation 204
7.3. Interaction light field–electron wave field 208
7.4. The interaction representation 212
7.5. The dipole approximation 218
7.6. Spontaneous and stimulated emission and absorption 222
7.7. Perturbation theory and Feynman graphs 230
7.8. Lamb shift 242
7.9. Once again spontaneous emission: Damping and line-width 251
7.10. How to return to the semiclassical approach. Example: A single mode, absorption and emission 254
7.11. The dynamic Stark effect 256

8. Quantum theory of coherence 265
8.1. Quantum mechanical coherence functions 265
8.2. Examples of the evaluation of quantum mechanical coherence functions 271
8.3. Coherence properties of spontaneously emitted light 275
8.4. Quantum beats 277

9. Dissipation and fluctuations in quantum optics 285
9.1. Damping and fluctuations of classical quantities: Langevin equation and Fokker–Planck equation 285
9.2. Damping and fluctuations of quantum mechanical variables: Field modes 295
9.3. Quantum mechanical Langevin equations. The origin of quantum mechanical fluctuating forces 297
9.4. Langevin equations for atoms and general quantum systems 304
9.5. The density matrix 316
Mathematical Appendix 335
