

CONTENTS

Preface	xi
1 Introduction	1
1.1 Dense Plasmas in Nature	1
1.1.1 Astrophysical Dense Plasmas	2
1.1.2 Dense Plasmas in Laboratories	6
1.2 Basic Parameters	7
1.2.1 Classical OCP	8
1.2.2 Electron Liquids at Metallic Densities	9
1.3 Consequences on the Coulomb Interaction	10
1.3.1 Scattering by Coulomb Forces	10
1.3.2 Debye Screening	11
1.3.3 The Ion-Sphere Model	13
1.3.4 Plasma Oscillation	15
1.3.5 Collective Motion and Individual-Particles Behavior	17
2 Fundamentals	19
2.1 Density-Fluctuation Excitations	19
2.1.1 System of Identical Particles	19
2.1.2 Structure Factors and Correlation Energy	21
2.1.3 System of Electrons at Metallic Densities	22
2.2 Dielectric Formulation	23
2.2.1 Density–Density Response Functions	24
2.2.2 Correlations, Radial Distributions, and Statistical Thermodynamics	25
2.2.3 Spin-Density Response	26
2.2.4 The Hartree–Fock Approximation	26
2.2.5 The Random-Phase Approximation	27
2.2.6 Collective versus Individual-Particles Aspects of Fluctuations	28
2.2.7 Strong Coupling Effects	29
2.3 Density-Functional Theory	32
2.3.1 Kohn–Sham Self-Consistent Equations	32
2.3.2 Thermodynamic Potentials	34
2.4 Computer Simulation Methods	36
2.4.1 Monte Carlo Approaches	36
2.4.2 Molecular Dynamics Simulations	36
2.4.3 Other Approaches	37

3 Scattering of Electromagnetic Waves	39	5.2.2 OCP pressure	74
3.1 Scattering by Individual Particles	39	5.2.3 Solid Free Energy	74
3.1.1 Cross-Section of Thomson Scattering	40	5.2.4 Wigner Crystallization	75
3.1.2 Doppler Effect	40	5.3 Equations of State for Quantum Electron Liquids	75
3.2 Incoherent Scattering by Correlated Particles	42	5.3.1 Ideal-Gas Contributions	75
3.3 Radar Backscattering from the Ionosphere	43	5.3.2 Exchange–Correlation Contributions	76
3.3.1 Observations by Bowles	43	5.3.3 Origin of Cohesive Forces	77
3.3.2 Observations by Pineo, Kraft, and Briscoe	44	5.4 Freezing and Ferromagnetic Transitions in Electron Liquid	78
3.4 Collective Phenomena in Electron-and-Ion Plasmas	45		
3.4.1 Dielectric Response Function	46		
3.4.2 Dressed Particles	47		
3.4.3 Ion-Acoustic Waves	48		
3.5 Plasma Critical Opalescence	49		
3.6 Observation of Plasma Waves in Warm Dense Matter	50		
4 Charged Particles or X-Rays Injected in Plasmas	53	6 Phase Diagrams of Hydrogen	79
4.1 Characteristic Energy-Loss Spectroscopy	53	6.1 States of Hydrogen	79
4.2 Plasmon Dispersion	55	6.1.1 Molecular Hydrogen	80
4.2.1 Plasmon Dispersion Coefficient	56	6.1.2 Pressure Ionization	80
4.2.2 Measured Values	57	6.1.3 Laboratory Realization of Metallic Hydrogen	81
4.2.3 Theoretical Estimates	57	6.1.4 Metallic Hydrogen in Astrophysical Objects	81
4.3 Stopping Power and Wake Potential	58	6.1.5 Nuclear Reactions	81
4.3.1 Induced Density Variations	59	6.2 Equations of State for Hydrogen	82
4.3.2 Induced Potential	61	6.2.1 Molecular Fluids	82
4.3.3 Stopping Power	61	6.2.2 Molecular Solids	83
4.4 Ion Clusters Injected in Metals	62	6.3 Phases of Hydrogen Matter	84
4.4.1 Injection into Thin Foils	62	6.3.1 Equations of State for the Fluid Phase	84
4.4.2 Advanced Wakefield Experiment	62	6.3.2 Short-Range Screening by Electrons	85
4.5 X-Ray Crystallography	63	6.4 Coexistence Curves and Thermodynamics	86
4.6 Observation of Laue Patterns in Coulomb Glasses	63	6.4.1 Phase Diagram and Coexistence Curves	87
4.6.1 Madelung Energy	63	6.4.2 Thermodynamics across the MI Transitions	88
4.6.2 Layered Structures at Various Quenches	64	6.5 Metal–Insulator Transitions	88
4.6.3 Laue Patterns for Glasses	66		
4.7 X-Ray Thomson Scattering and Time-Resolved XANES Diagnostic with High Energy Density Plasmas	69	7 Transport Processes	91
		7.1 Electric and Thermal Resistivity	91
5 Thermodynamics of Classical OCP and Quantum Electron Liquids	71	7.1.1 Parameterized Formulae	92
5.1 Radial Distribution Functions and Correlation Energies	71	7.1.2 Generalized Coulomb Logarithms	92
5.1.1 Correlation Energy in the RPA	72	7.1.3 Screened Potentials	93
5.1.2 Multi-Particle Correlation	73	7.1.4 The IRS Parameter	94
5.2 OCP Thermodynamic Functions	73	7.2 Ultrahigh-Pressure Metal Physics Experiments	95
5.2.1 OCP Free Energy	74	7.2.1 Interpreting the Experiments	95
		7.2.2 Compression and Metallization	96
		7.2.3 Examining the Data	97
		7.2.4 The First-Order MI Transitions Justified	98
		7.3 Jovian Interiors and Excess Infrared Luminosity	99
		7.3.1 Structure of Jupiter	100
		7.3.2 Origins of the Excess Luminosity	101
		7.3.3 The MI Transitions and Luminosity	101

8 Stellar and Planetary Magnetism	103	10.3 Structure of a Neutron Star 10.3.1 Three-Part Structure 10.3.2 Non-Radial Oscillations 10.3.3 Central Core	127 127 128 128
8.1 Jovian Magnetic Activities	103		
8.1.1 Metallic Hydrogen in Jupiter	103		
8.1.2 Magnetic Reynolds Number	104		
8.1.3 Magnetic Activities	104		
8.2 Ferromagnetic and Freezing Transitions in Metallic Hydrogen	105		
8.2.1 Equations of State with Spin Polarization	105		
8.2.2 Phase Diagrams with Spin Polarization	105		
8.3 Nuclear Ferromagnetism with Magnetic White Dwarfs	105		
8.3.1 Hydrogen with Magnetic White Dwarfs	105		
8.3.2 Origin of Strong Magnetization	107		
8.3.3 Field Amplification by Stellar Rotation	107		
9 Nuclear Fusion in Metallic Hydrogen	109		
9.1 Thermonuclear and Pycnonuclear Reactions	110		
9.1.1 Scattering by the Coulomb Potential	110		
9.1.2 Probability of Penetration—Bare Coulomb Repulsion	111		
9.1.3 Cross-Section Factor	112		
9.1.4 Probability of Penetration—Screened Coulomb Repulsion	113		
9.1.5 Rates of Thermonuclear Reactions	115		
9.1.6 Rates of Pycnonuclear Reactions	116		
9.2 Solar Processes and Inertial-Confinement Fusion	117		
9.2.1 Inertial-Confinement Fusion	117		
9.2.2 The p - p Chain	117		
9.3 Enhancement of Nuclear Reactions in Metallic Fluids	118		
9.3.1 Enhancement Due to Coulomb Correlation	118		
9.3.2 Enhancement Factor	119		
9.3.3 Rates of Nuclear Reactions in Dense Plasmas	121		
9.4 "Supernova on the Earth"	121		
9.4.1 Adiabatic Compression	121		
9.4.2 Metallization	122		
9.4.3 Feasibility Experiment	122		
9.4.4 Power-Production Experiment	123		
10 Phase Diagrams of Nuclear Matter	125		
10.1 Deconfinement of Quarks from Nucleons	125		
10.1.1 Relativistic Heavy Ion Collider Experiments	125		
10.1.2 The Oldest Phase of Matter	126		
10.2 Phases of Nuclear Matter	126		
10.2.1 Phase Diagrams	126		
10.2.2 Deconfinement versus Metallization	126		
11 Plasma Phenomena around Neutron Stars and Black Holes	129		
11.1 Pulsars	130		
11.1.1 Discovery	130		
11.1.2 Characteristic Features	130		
11.1.3 Crab and Vela Pulsars	132		
11.2 Rotating Magnetic Neutron Stars	132		
11.2.1 What Are the Pulsars?	132		
11.2.2 Pulsar Magnetic Field	133		
11.2.3 Spinning Down of Pulsars by Magnetic Dipole Radiation	134		
11.2.4 Spinning Down of Crab Pulsar and the Crab Nebula Activities	135		
11.2.5 Constructing the Radio Beams	136		
11.2.6 Creating the Plasmas	138		
11.2.7 A Pulsar Emission Mechanism	139		
11.3 X-Ray Pulsars	140		
11.3.1 Close Binary Systems	140		
11.3.2 Accretion	141		
11.3.3 Cyclotron Resonance Scattering Feature	143		
11.3.4 Accretion Model of X-ray Pulsars	143		
11.4 Black Hole Model of Cygnus X-1	144		
11.4.1 Energy Spectra and Variability of X-ray Emission	144		
11.4.2 Mass Estimate	145		
11.4.3 Plasma Accretion to a Black Hole	147		
11.4.4 A Black Hole Model of Cyg X-1 Observation	148		
11.5 Stellar-Mass Black Holes and Supermassive Black Holes	150		
11.5.1 Microquasars	150		
11.5.2 Supermassive Black Hole in the Galaxy	151		
11.5.3 Burst of γ -ray from a Supermassive Black Hole Breaking Apart and Swallowing a Nearby Star	152		
12 Dawn of Gravitational-Wave Astronomy	155		
12.1 Hulse-Taylor Binary Pulsars	156		
12.2 GW150915: The First Signals for LIGO	156		
12.2.1 Information Extracted from the Signals	157		
12.2.2 Items to Be Ensured with the Signals	159		
12.3 Observation of Colliding Binary Neutron Stars	159		

Appendix I: The δ-Functions	163
Appendix II: Fourier Analyses and Application	165
Appendix III: The Fluctuation-Dissipation Theorem	169
Appendix IV: Fermi Integrals	173
Appendix V: Functional Derivatives	175
References	177
