Contributors	ix
Preface	xi
1. Numerical challenges in turbulence simulation	
Robert D. Moser	
1.1 A brief introduction to turbulence	1
1.2 Numerical discretization of convection	13
1.3 Numerical discretization of diffusion	29
1.4 Numerical time discretization	34
Acknowledgments	41
References	42
2. Spectral numerical methods for turbulence simulation	
Robert D. Moser	
2.1 Motivation	45
2.2 General characteristics of spectral methods	46
2.3 Fourier spectral methods	61
2.4 Orthogonal polynomials	74
2.5 Spectral methods with polynomial bases	80
2.6 Time discretization for spectral methods	89
Acknowledgments	91
References	91
3. Spectral element methods for turbulence	
Paul F. Fischer and Ananias G. Tomboulides	
3.1 Introduction	95
3.2 Advection-diffusion in a single deformed element	98
3.3 The multielement case	108
3.4 $\mathbb{P}_N - \mathbb{P}_N$ formulation for incompressible flows	111
3.5 $\mathbb{P}_N - \mathbb{P}_N$ formulation for low-Mach-number flows	118
3.6 Computing the pressure	121
3.7 Practical aspects	126
3.8 Example applications	130
References	133

4. Spline-based methods for turbulence

John A. Evans

4.1 Introduction	139
4.2 A brief introduction to splines	144
4.3 Spline-based methods for incompressible flows	153
4.4 A selection of spline velocity/pressure pairs	169
4.5 Stabilized spline-based methods	173
References	180

5. Finite element methods for turbulence

Kenneth E. Jansen and Jed Brown

5.1 Introduction	189
5.2 Discretization foundations	191
5.3 Finite element formulations	197
5.4 Implementation	215
5.5 Scale resolving turbulence simulations	227
References	230

6. Finite difference methods for turbulence simulations

Aditya Ghate and Sanjiva K. Lele

6.1 Introduction	235
6.2 Grid topologies	237
6.3 Grid staggering and flux evaluations	245
6.4 Robustness of inviscid flux discretization	253
6.5 Finite difference schemes for LES: dispersion/dissipation errors	262
6.6 Discretization challenges specific to incompressible flows	269
6.7 Additional considerations	272
6.8 Summarizing remarks	275
References	276

7. Unstructured finite volume approaches for turbulence

Stefan P. Domino

7.1 Introduction	285
7.2 Finite volume discretization	288
7.3 High Peclet number advection and diffusion	299
7.4 Transient advection and diffusion illustration	305
7.5 Low-Mach solver strategies	308
7.6 Low-Mach fluids operators	309
7.7 Validation	310
Acknowledgments	312
References	312

8. Boundary conditions for turbulence simulation

Tim Colonius

8.1 Introduction	319
8.2 A motivating example	320
8.3 General framework	325
8.4 BCs for compressible Navier–Stokes	331
8.5 BCs for incompressible Navier–Stokes	343
8.6 Turbulence modeling in boundary conditions	349
8.7 BCs in other discretization schemes	353
References	354

9. Numerical methods in large-eddy simulation

Pierre Sagaut

9.1 Scope of the chapter	359
9.2 Large-eddy simulation: from practice to theory	360
9.3 Implicit coupling between numerics and explicit subgrid models	369
9.4 LES numerics: beyond order of accuracy	385
9.5 Concluding remarks	388
References	388

10. Numerical approximations formulated as LES models

Fernando F. Grinstein, Filipe S. Pereira, and William J. Rider

10.1 Coarse grained simulations	393
10.2 Turbulence Reynolds number and mixing transition	399
10.3 Compressible numerical hydrodynamics	402
10.4 Case studies	412
10.5 Summary and conclusions	429
Acknowledgments	430
References	430

11. Numerical treatment of incompressible turbulent flow

Roel W.C.P. Verstappen and Arthur E.P. Veldman

11.1 Introduction	435
11.2 Flow equations	438
11.3 Energy-preserving discretization	439
11.4 Incompressible flow – staggered grid	442
11.5 Time integration	448
11.6 Numerical simulation of incompressible turbulent flow	450
11.7 Counterbalancing the production of unresolved scales	457
References	463

12. Numerical treatment of compressible turbulent flows

Krishnan Mahesh

12.1 Introduction	469
12.2 Hou and Mahesh (2005) algorithm	472
12.3 Characteristic-based filtering for shock-capturing	480
12.4 Multiphase compressible flows – cavitation	487
12.5 Concluding remarks	496
Acknowledgments	497
References	497

13. Numerical treatment of turbulent reacting flows

Luc Vervisch, Pascale Domingo, and John Bell

13.1 Challenges in reacting flow simulations	501
13.2 Modifications to the Navier–Stokes equations for reacting flows	502
13.3 Scales, characteristic numbers and mesh resolution in reacting flow simulation	512
13.4 Modeling subgrid scale effects in reacting flows	514
13.5 Numerical formulations for reacting flows	515
13.6 Numerical methods for chemistry	523
13.7 Adaptive mesh refinement for reacting flows	531
References	535
