

Contents

1	Introduction to High-Energy-Density Physics	1
1.1	Some Historical Remarks	2
1.2	Regimes of High-Energy-Density Physics	5
1.3	An Introduction to Inertial Confinement Fusion	8
1.4	An Introduction to Experimental Astrophysics	11
1.5	Some Connections to Prior Work	14
1.6	Variables and Notation	16
2	Descriptions of Fluids and Plasmas	19
2.1	The Euler Equations for a Polytopic Gas	19
2.2	The Maxwell Equations	24
2.3	More General and Complete Single-Fluid Equations	26
2.3.1	General Single-Fluid Equations	27
2.3.2	Magnetohydrodynamics	33
2.3.3	Single Fluid, Three Temperature	36
2.3.4	Approaches to Computer Simulation	37
2.4	Plasma Theories	40
2.4.1	Regimes of Validity of Traditional Plasma Theory	40
2.4.2	The Two-Fluid Equations	44
2.4.3	The Kinetic Description	49
2.5	Single-Particle Motions	50
3	Properties of High-Energy-Density Plasmas	55
3.1	Simple Equations of State	57
3.1.1	Polytropic Gases	57
3.1.2	Radiation-Dominated Plasma	59
3.1.3	Fermi-Degenerate EOS	60
3.2	Ionizing Plasmas	66
3.2.1	Ionization Balance from the Saha Equation	68
3.2.2	Continuum Lowering and the Ion Sphere Model	73
3.2.3	Coulomb Interactions	78
3.3	Thermodynamics of Ionizing Plasmas	80
3.3.1	Generalized Polytropic Indices	81
3.3.2	Pressure, Energy, and Their Consequences	84
3.3.3	The EOS Landscape	89

3.4	Equations of State for Computations	90	5.2.3	Rayleigh–Taylor with Density Gradients and the Global Mode	187
3.4.1	The Thomas–Fermi Model and QEOS	91	5.3	The Convective Instability or the Entropy Mode	190
3.4.2	Tabular Equations of State	93	5.4	Buoyancy-Drag Models of the Nonlinear Rayleigh–Taylor State	193
3.5	Equations of State in the Laboratory and in Astrophysics	96	5.5	Mode Coupling	195
3.5.1	The Astrophysical Context for EOS	97	5.6	The Kelvin–Helmholtz Instability	202
3.5.2	Connecting EOS from the Laboratory to Astrophysics	99	5.6.1	Fundamental Equations for Kelvin–Helmholtz Instabilities	203
3.6	Experiments to Measure Equations of State	100	5.6.2	Uniform Fluids with a Sharp Boundary	206
3.6.1	Direct Flyer-Plate Measurements	101	5.6.3	Otherwise Uniform Fluids with a Distributed Shear Layer	208
3.6.2	Impedance Matching	101	5.6.4	Uniform Fluids with a Transition Region	209
3.6.3	Other Techniques	103	5.7	Shock Stability and Richtmyer–Meskov Instability	213
4	Shocks and Rarefactions	107	5.7.1	Shock Stability	213
4.1	Shock Waves	108	5.7.2	Interaction of Shocks with Rippled Interfaces	217
4.1.1	Jump Conditions	109	5.7.3	Postshock Evolution of the Interface; Richtmyer Meshkov Instability	219
4.1.2	The Shock Hugoniot and Equations of State	111	5.8	Hydrodynamic Turbulence	224
4.1.3	Useful Shock Relations	112	6	Radiative Transfer	237
4.1.4	Entropy Changes Across Shocks	118	6.1	Basic Concepts	239
4.1.5	Oblique Shocks	119	6.1.1	Properties and Description of Radiation	239
4.1.6	Shocks and Interfaces, Flyer Plates	122	6.1.2	Thermal Radiation	244
4.2	Rarefaction Waves	128	6.1.3	Types of Interaction Between Radiation and Matter	244
4.2.1	The Planar Isothermal Rarefaction and Self-Similar Analysis	129	6.1.4	Description of the Net Interaction of Radiation and Matter	247
4.2.2	Riemann Invariants	132	6.2	Radiation Transfer	249
4.2.3	Planar Adiabatic Rarefactions	136	6.2.1	The Radiation Transfer Equation	249
4.3	Blast Waves	139	6.2.2	Radiative Transfer Calculations	250
4.3.1	Energy Conservation in Blast Waves	140	6.2.3	Opacities in Astrophysics and the Laboratory	255
4.3.2	A General Discussion of Self-Similar Motions	142	6.2.4	Radiation Transfer in the Equilibrium Diffusion Limit	258
4.3.3	The Sedov–Taylor Spherical Blast Wave	146	6.2.5	Nonequilibrium Diffusion and Two-Temperature Models	261
4.4	Phenomena at Interfaces	149	6.3	Relativistic Considerations for Radiative Transfer	262
4.4.1	Shocks at Interfaces and Their Consequences	149	7	Radiation Hydrodynamics	267
4.4.2	Overtaking Shocks	153	7.1	Radiation Hydrodynamic Equations	270
4.4.3	Reshocks in Rarefactions	154	7.1.1	Fundamental Equations	270
4.4.4	Blast Waves at Interfaces	156	7.1.2	Thermodynamic Relations	272
4.4.5	Rarefactions at Interfaces	158	7.2	Radiation and Fluctuations	274
4.4.6	Oblique Shocks at Interfaces	162	7.2.1	Radiative Acoustic Waves; Optically Thick Case	274
5	Hydrodynamic Instabilities	169	7.2.2	Cooling When Transport Matters	277
5.1	Introduction to the Rayleigh–Taylor Instability	170	7.2.3	Optically Thin Acoustic Waves	282
5.1.1	Buoyancy as a Driving Force	171	7.2.4	Radiative Thermal Instability	285
5.1.2	Fundamentals of the Fluid-Dynamics Description	175			
5.2	Applications of the Linear Theory of the Rayleigh–Taylor Instability	180			
5.2.1	Rayleigh–Taylor Instability with Two Uniform Fluids	180			
5.2.2	Effects of Viscosity on the Rayleigh–Taylor Instability	182			

7.3	Radiation Diffusion and Marshak Waves	287	9.2.4	Fast Ignition	412
7.3.1	Marshak Waves	287	9.3	Pitfalls and Problems	415
7.3.2	Ionizing Radiation Wave	291	9.3.1	Rayleigh Taylor	415
7.3.3	Constant-Energy Radiation Diffusion Wave	293	9.3.2	Symmetry	418
7.4	Radiative Shocks	296	9.3.3	Laser-Plasma Instabilities	419
7.4.1	Regimes of Radiative Shocks	296	10	Experimental Astrophysics	423
7.4.2	Fluid Dynamics of Radiative Shocks	301	10.1	Scaling in Hydrodynamic Systems	424
7.4.3	Models of Radiative Precursors	309	10.2	A Thorough Example: Interface Instabilities	
7.4.4	Optically Thin Radiative Shocks	317		in Type II Supernovae	428
7.4.5	Radiative Shocks that are Thick Downstream		10.2.1	The Astrophysical Context for Type II Supernovae	429
	and Thin Upstream	320	10.2.2	The Scaling Problem for Interface Instabilities	
7.4.6	Fluid Dynamics of Optically Thick Radiative Shocks	324		in Supernovae	432
7.4.7	Optically Thick Shocks-Radiative-Flux Regime	326	10.2.3	Experiments on Interface Instabilities	
7.4.8	Radiation-Dominated Optically Thick Shocks	328		in Type II Supernovae	436
7.4.9	Electron-Ion Coupling in Shocks	330	10.3	A Second Example: Cloud-Crushing Interactions	439
7.5	Ionization Fronts	332	10.4	Scaling in Radiation Hydrodynamic Systems	441
8	Creating High-Energy-Density Conditions	335	10.5	Radiative Astrophysical Jets: Context and Scaling	443
8.1	Direct Laser Irradiation	336	10.5.1	The Context for Jets in Astrophysics	443
8.1.1	Laser Technology	336	10.5.2	Scaling from Radiative Astrophysical Jets	
8.1.2	Laser Focusing	338		to the Laboratory	445
8.1.3	Propagation and Absorption		10.5.3	Radiative Jet Experiments	447
	of Electromagnetic Waves	341	11	Relativistic High-Energy-Density Systems	449
8.1.4	Laser Scattering and Laser-Plasma Instabilities	347	11.1	Development of Ultrafast Lasers	451
8.1.5	Electron Heat Transport	354	11.2	Single-Electron Motion in Intense Electromagnetic Fields	452
8.1.6	Ablation Pressure	361	11.3	Initiating Relativistic Laser-Plasma Interactions	461
8.2	Hohlraums	366	11.4	Absorption Mechanisms	464
8.2.1	X-Ray Conversion of Laser Light	367	11.5	Harmonic Generation	467
8.2.2	X-Ray Production by Ion Beams	372	11.6	Relativistic Self-Focusing and Induced Transparency	469
8.2.3	X-Ray Ablation	372	11.7	Particle Acceleration	470
8.2.4	Problems with Hohlraums	376	11.7.1	Acceleration Within Plasmas	470
8.3	Z-Pinches and Related Methods	379	11.7.2	Acceleration by Surface Potentials on Solid Targets	474
8.3.1	Z-Pinches for High-Energy-Density Physics	380	11.7.3	Acceleration by Coulomb Explosions	475
8.3.2	Dynamic Hohlraums	387	11.8	Hole Drilling and Collisionless Shocks	478
8.3.3	Magnetically Driven Flyer Plates	390	11.9	Other Phenomena	482
9	Inertial Confinement Fusion	391	12	Appendix A: Constants, Acronyms,	
9.1	The Final State	392		and Standard Variables	485
9.1.1	What Fuel, Under What Conditions?	393	13	Appendix B: Sample <i>Mathematica</i> Code	491
9.1.2	Energy Gain: Is This Worth Doing?	396	14	Appendix C: A List of the Homework Problems	501
9.1.3	Properties of Compressed DT Fuel	397	Index		529
9.2	Creating and Igniting the Final State	402			
9.2.1	Achieving a Highly Compressed State	402			
9.2.2	Igniting the Fuel	407			
9.2.3	Igniting from a Central Hot Spot	410
