

Contents

1	Introduction	1
1.1	Ways to control the emission of light	1
1.2	From the control of light to the control of atoms and molecules	7
1.3	On the aims of this book	10
2	Elementary radiative processes	12
2.1	Spontaneous emission	12
2.2	Stimulated absorption and emission	15
2.3	Recoil effect and Doppler effect	18
2.4	Resonant excitation of a two-level system free from relaxation	22
2.5	Resonant excitation of a two-level system with relaxations	26
2.6	Radiation-scattering processes	33
3	Laser velocity-selective excitation	35
3.1	Doppler broadening of optical spectral lines	35
3.2	Homogeneous broadening mechanisms	38
3.3	Doppler-free saturation spectroscopy	40
3.4	Ultrahigh spectral resolution	49
4	Optical orientation of atoms and nuclei	54
4.1	Optical orientation of atoms	54
4.2	Radio-frequency spectroscopy of optically oriented atoms	58
4.3	Spin-exchange optical pumping	61
4.4	Coherent effects and optically oriented atoms	62
4.5	Applications of optically pumped atoms	64
5	Laser cooling of atoms	68
5.1	Introduction. History of ideas	69
5.2	Laser radiation force on a two-level atom	72
5.3	Quantum fluctuation effects. Temperature limits of laser cooling	76
5.4	Doppler cooling	77
5.5	Laser polarization gradient cooling below the Doppler limit	83
5.6	Cooling below the recoil limit	87

6 Laser trapping of atoms	92	12 Coherent laser control of molecules	224
6.1 Optical trapping	92	12.1 Introduction to coherent optimal control	225
6.2 Magnetic trapping	100	12.2 Coherent control using wave packets	226
6.3 Magneto-optical trapping	103	12.3 Coherent control using quantum interference	229
6.4 Gravitooptical and near-field traps	106	12.4 Optimal feedback control	230
6.5 Optical trapping of cold atoms—new tools for atomic physics	109	12.5 Coherent optimal control by tailored strong-field laser pulses	232
7 Atom optics	113	12.6 Coherent control of large molecules in liquids	234
7.1 Introduction. Matter waves	113	12.7 Perspectives	235
7.2 Reflection of atoms by light	114	13 Related topics: laser control of microparticles and free electrons	238
7.3 Laser focusing of an atomic beam	120	13.1 Laser trapping of microparticles	238
7.4 Diffraction of atoms	127	13.2 Laser control of free-electron motion	244
7.5 Atom interferometry	130	14 Concluding comments	251
7.6 Atomic holography	135	References	273
7.7 Towards atom nanooptics	135	Index	303
8 From laser-cooled and trapped atoms to atomic and molecular quantum gases	138		
8.1 Introduction	139		
8.2 Bose–Einstein condensation of atomic gases	141		
8.3 Fermi-degenerate quantum atomic gases	148		
8.4 Formation of ultracold molecules	150		
8.5 Molecular quantum gases	155		
9 Laser photoselective ionization of atoms	158		
9.1 Introduction	158		
9.2 Resonance excitation and ionization of atoms	159		
9.3 Photoionization detection of rare atoms and radioactive isotopes	168		
9.4 Laser photoionization separation of isotopes, isobars, and nuclear isomers	175		
10 Multiphoton ionization of molecules	182		
10.1 Photoselective resonance ionization of molecules	183		
10.2 Resonance-enhanced multiphoton ionization (REMPI) of molecules	185		
10.3 Laser desorption/ionization of biomolecules	189		
11 Photoselective laser control of molecules via molecular vibrations	198		
11.1 Vibrationally mediated photodissociation of molecules via excited electronic states	199		
11.2 Basics of IR multiple-photon excitation/dissociation of polyatomic molecules in the ground state	201		
11.3 Characteristics of the IR MPE/D of polyatomic molecules	208		
11.4 Intermolecular selectivity of IR MPE/D for laser isotope separation	218		
11.5 Prospects for mode-selective MPE/D by IR femtosecond pulses	221
