<i>Preface</i>	v
<b>Deep Learning Basics</b>	<b>1</b>
1. Scope of this textbook	3
1.1 Data-driven methods . . . . .	3
1.2 Physics data analysis . . . . .	4
1.3 Machine learning methods . . . . .	5
1.4 Deep learning . . . . .	6
1.5 Statistical and systematic uncertainties . . . . .	8
1.6 Causes for rapid advancements . . . . .	9
1.7 Comprehension and hands-on . . . . .	9
2. Models for data analysis	13
2.1 Data in physics research . . . . .	13
2.2 Model building . . . . .	16
2.3 Data-driven model optimization . . . . .	18
3. Building blocks of neural networks	23
3.1 Linear mapping and displacement . . . . .	23
3.2 Nonlinear mapping: activation function . . . . .	24
3.3 Network prediction . . . . .	25
3.4 Universal approximation theorem . . . . .	28
3.5 Exercises . . . . .	29

4.	Optimization of network parameters	33	8.4	Advanced concepts	100
4.1	Preprocessing of input data	33	8.5	Convolutions beyond translational invariance	107
4.2	Epoch and batch	35	8.6	Physics applications	109
4.3	Parameter initialization	36	8.7	Exercises	112
4.4	Objective function	37	9.	Recurrent neural networks: time series and variable input	115
4.5	Gradients from backpropagation	42	9.1	Sequential relations and network architecture	115
4.6	Stochastic gradient descent	43	9.2	Recurrent neural networks	116
4.7	Learning rate	45	9.3	Training of recurrent networks	119
4.8	Learning strategies	46	9.4	Long short-term memory	119
4.9	Exercises	50	9.5	Gated recurrent unit	123
5.	Mastering model building	53	9.6	Application areas	125
5.1	Criteria for model building	53	9.7	Physics applications	129
5.2	Data sets for training, validation, test	56	9.8	Exercises	130
5.3	Monitoring	57	10.	Graph networks and convolutions beyond Euclidean domains	133
5.4	Regularization	58	10.1	Beyond Cartesian data structures	133
5.5	Hyperparameters and activation function	61	10.2	Graphs	135
5.6	Exercises	64	10.3	Construction of graphs	138
<b>Standard Architectures of Deep Networks</b>		<b>67</b>	10.4	Convolutions in the spatial domain	139
6.	Revisiting the terminology	69	10.5	Convolutions in the spectral domain	149
7.	Fully-connected networks: improving the classic all-rounder	71	10.6	Exercises	155
7.1	$N$ -layer fully-connected networks	71	11.	Multi-task learning, hybrid architectures, and operational reality	157
7.2	Regression challenge: two-dimensional location	72	11.1	Multi-task learning	157
7.3	Classification challenge: two image categories	75	11.2	Combination of network concepts	158
7.4	Challenges of training deep networks	76	11.3	Operational reality and verification	159
7.5	Residual neural networks	79	11.4	Physics applications	159
7.6	Batch normalization	80	11.5	Exercises	163
7.7	Self-normalizing neural networks	81	<b>Introspection, Uncertainties, Objectives</b>		<b>165</b>
7.8	Exercises	84	12.	Interpretability	167
8.	Convolutional neural networks and analysis of image-like data	87	12.1	Interpretability and deep neural networks	167
8.1	Convolutional neural networks	87	12.2	Model interpretability and feature visualization	168
8.2	Comparison to fully-connected networks	97	12.3	Interpretability of predictions	173
8.3	Reconstruction tasks	99	12.4	Exercises	181

13. Uncertainties and robustness	185	18.4 Physics applications	263
13.1 Measuring uncertainties	186	18.5 Exercises	267
13.2 Decorrelation	189	19. Domain adaptation, refinement, unfolding	271
13.3 Adversarial attacks	191	19.1 Refinement for simulations to appear data-like	272
13.4 Exercises	192	19.2 Scale factors	276
14. Revisiting objective functions	195	19.3 Common representation	277
14.1 Fitting function parameters to data	196	19.4 Unfolding	278
14.2 Reproducing probability distributions	196	20. Model independent detection of outliers and anomalies	285
14.3 Conditional probability in supervised learning	201	20.1 Basics	286
14.4 Adaptive objective function	204	20.2 Low background density	288
14.5 Hamiltonian gradient objective function	205	20.3 Likelihood-ratio based detection	289
14.6 Energy-based objective function	207	20.4 Exercises	291
14.7 Learning without gradients	209	21. Beyond the scope of this textbook	293
14.8 Different types of objectives	210	21.1 Dedicated hardware and microsystems	293
<b>Deep Learning Advanced Concepts</b>	<b>215</b>	21.2 Neuroscience inspired developments	294
15. Beyond supervised learning	217	21.3 Information field theory	295
16. Weakly-supervised classification	219	21.4 Human readable physics concepts	295
16.1 Incomplete supervision	220	Appendix A Notations	297
16.2 Inexact supervision	221	<i>Bibliography</i>	299
16.3 Inaccurate supervision	222	<i>Index</i>	317
16.4 Exercises	224		
17. Autoencoders: finding and compressing structures in data	227		
17.1 Autoencoder networks	227		
17.2 Categories of autoencoders	229		
17.3 Application areas	233		
17.4 Physics applications	234		
17.5 Exercises	236		
18. Generative models: data from noise	239		
18.1 Variational autoencoder	241		
18.2 Generative adversarial networks	243		
18.3 Normalizing flows	257
