<i>Preface</i>	v
1. Introduction	1
2. Models in Inverse Problems	5
2.1 Introduction	5
2.2 Elliptic inverse problems	6
2.2.1 Cauchy problem	6
2.2.2 Inverse source problem	8
2.2.3 Inverse scattering problem	10
2.2.4 Inverse spectral problem	13
2.3 Tomography	15
2.3.1 Computerized tomography	16
2.3.2 Emission tomography	19
2.3.3 Electrical impedance tomography	20
2.3.4 Optical tomography	23
2.3.5 Photoacoustic tomography	25
3. Tikhonov Theory for Linear Problems	29
3.1 Well-posedness	31
3.2 Value function calculus	38
3.3 Basic estimates	44
3.3.1 Classical source condition	45
3.3.2 Higher-order source condition	52
3.4 A posteriori parameter choice rules	55
3.4.1 Discrepancy principle	55

3.4.2	Hanke-Raus rule	66	5.2.4	Gauss-Newton method	188
3.4.3	Quasi-optimality criterion	71	5.2.5	Semismooth Newton Method	189
3.5	Augmented Tikhonov regularization	76	5.3	ℓ^p sparsity optimization	193
3.5.1	Augmented Tikhonov regularization	77	5.3.1	ℓ^0 optimization	194
3.5.2	Variational characterization	80	5.3.2	ℓ^p ($0 < p < 1$)-optimization	195
3.5.3	Fixed point algorithm	88	5.3.3	Primal-dual active set method	197
3.6	Multi-parameter Tikhonov regularization	91	5.4	Nonsmooth nonconvex optimization	200
3.6.1	Balancing principle	92	5.4.1	Biconjugate function and relaxation	201
3.6.2	Error estimates	95	5.4.2	Semismooth Newton method	204
3.6.3	Numerical algorithms	99	5.4.3	Constrained optimization	206
4.	Tikhonov Theory for Nonlinear Inverse Problems	105	6.	Direct Inversion Methods	209
4.1	Well-posedness	106	6.1	Inverse scattering methods	209
4.2	Classical convergence rate analysis	112	6.1.1	The MUSIC algorithm	210
4.2.1	A priori parameter choice	113	6.1.2	Linear sampling method	215
4.2.2	A posteriori parameter choice	117	6.1.3	Direct sampling method	218
4.2.3	Structural properties	124	6.2	Point source identification	223
4.3	A new convergence rate analysis	128	6.3	Numerical unique continuation	226
4.3.1	Necessary optimality condition	128	6.4	Gel'fand-Levitan-Marchenko transformation	228
4.3.2	Source and nonlinearity conditions	129	6.4.1	Gel'fand-Levitan-Marchenko transformation	228
4.3.3	Convergence rate analysis	134	6.4.2	Application to inverse Sturm-Liouville problem	232
4.4	A class of parameter identification problems	141	7.	Bayesian Inference	235
4.4.1	A general class of nonlinear inverse problems	141	7.1	Fundamentals of Bayesian inference	237
4.4.2	Bilinear problems	144	7.2	Model selection	244
4.4.3	Three elliptic examples	145	7.3	Markov chain Monte Carlo	250
4.5	Convergence rate analysis in Banach spaces	150	7.3.1	Monte Carlo simulation	250
4.5.1	Extensions of the classical approach	150	7.3.2	MCMC algorithms	253
4.5.2	Variational inequalities	152	7.3.3	Convergence analysis	258
4.6	Conditional stability	160	7.3.4	Accelerating MCMC algorithms	261
5.	Nonsmooth Optimization	169	7.4	Approximate inference	267
5.1	Existence and necessary optimality condition	172	7.4.1	Kullback-Leibler divergence	268
5.1.1	Existence of minimizers	172	7.4.2	Approximate inference algorithms	271
5.1.2	Necessary optimality	173	Appendix A	Singular Value Decomposition	285
5.2	Nonsmooth optimization algorithms	177	Appendix B	Noise Models	289
5.2.1	Augmented Lagrangian method	177	Appendix C	Exponential Families	295
5.2.2	Lagrange multiplier theory	181			
5.2.3	Exact penalty method	184
