Preface	vii
Acknowledgments	x
<b>Part I</b>	
Survey of underlying theory	
<b>1 Continuous, point and line processes</b>	<b>3</b>
1.1 Continuous processes $X(\mathbf{r})$ . Autocorrelation and spectral theory	3
1.2 Point processes $N(\mathbf{r})$ . Some specific models and their distributional theory	6
1.2.1 Spectral theory	9
1.2.2 Contagion and inhibitory models	11
1.3 Line processes	12
<b>2 Nearest-neighbour systems on a lattice</b>	<b>18</b>
2.1 Lattice processes $X_i$ . Continuous variables. Conditional and simultaneous systems	18
2.1.1 Markov fields in continuous space	28
2.2 Binary and other discrete variables	29
2.2.1 The auto-logistic model	31
2.2.2 Sub-critical 'temperatures'	37
2.3 General specification of conditional lattice systems	40
2.3.1 Spatial-temporal processes for other auto-schemes	42

**Part II**

## Examples of statistical analyses

<b>3</b>	<b>Analyses of continuous and point processes</b>	<b>47</b>
3.1	Continuous processes $X(r)$ . Pielou's example	47
3.2	Point processes. A simulated clustering model. $\chi^2$ analyses. Mead's randomization test	49
3.2.1	Spectral analysis	57
3.2.2	Nearest-neighbour distances between gulls' nests	59
3.3	Line processes	64
<b>4</b>	<b>Analyses of processes on a lattice</b>	<b>67</b>
4.1	Lattice processes $X_i$ . Continuous variables. Examples using simultaneous and conditional models	67
4.2	Discrete variables. Simple $\chi^2$ analyses. Further analyses and examples	71
Appendix	Tables AI and AII	82
